**AN EXCLUSIVE  
INTERVIEW WITH  
TRENT REZNOR**

# Korg changes the rules:

## One day, every music workstation is going to be like this.

**Presenting Korg Trinity.** Welcome to the second revolution in music workstations. From the people who brought you the first.

Trinity™ is a series of keyboards with a groundbreaking modular design. So you can start with the basics (two loaded sound banks and a powerful sequencer),

and turn it into a full digital recording environment with a vast array of sounds and effects.

The 61-note Trinity and Trinity Plus both feature a new tone generation system that plays back at 48kHz, with a huge 24MB PCM ROM. A Flash ROM option lets you load additional sounds from Korg and Akai libraries. And far better than

- 24MB internal PCM ROM.
- Multi-mode digital resonant filters.
- 114 dynamic multi-effects; 8 insert and 2 master effects available simultaneously.
- Built-in 16-track, 80,000-note sequencer.
- Large TouchView™ Graphical User Interface.
  - Dynamic Ribbon Controller, joystick, assignable switches, pedal and foot controllers.
- 256 Programs & 256 Combinations (Banks A & B)
- Optional 8MB PCM Flash ROM for sounds from Korg and Akai libraries (Banks C & D).
- Optional Prophecy Solo Synthesizer (Bank S) Contains 64 programs (128 with Flash ROM).
- Optional 4-track hard disk recording system with SCSI and S/P DIF I/Os.
- Four polyphonic outputs, plus optional ADAT digital interface
- 76-note Trinity Pro and 88-note, weighted-action Trinity ProX coming soon!

mere sound boards, you can add a whole new synthesizer: The Prophecy Solo Synthesizer\* option gives you DSP models of synths and acoustic instruments.

You also have an option for 4-track hard disk recording, to let you record any sound (using built-in effects if you wish). The only thing more amazing is that you control it all with one finger – with a large touch-sensitive screen.

In your lifetime, you're only going to see a few keyboards that literally change the way you play. So savor this one. Trinity is here.

## Features

- 20 12 WHO COUNT: TRENT REZNOR**  
WHO ELSE BUT THE MEISTER OF MODERN electronic angst should we select to round out this year's series of probing interviews? Trent gives us a peek inside his new studio and muses about spontaneity and his stage persona. David Lee Roth he ain't.
- 37 MEET THE BUYER'S GUIDE**  
TO PARAPHRASE BOB DYLAN . . . IT'S A hard, it's a hard, it's a hard, it's a hard ware gonna be on display this year. All the stuff we could fit (as long as it doesn't require a computer), we print.
- 39 SYNTHESIZERS & TONE MODULES**  
EVERYTHING FROM ANALOG RACK-mounts to 88-key workstations, from preset GM boxes to infinitely deep programmables. A feature-by-feature chart gives the scoop on about 90 different instruments.
- 57 SAMPLERS**  
FROM DAC TO RACK AND BACK: FEATURE-by-feature chart comparisons of 18 samplers.
- 69 DIGITAL PIANOS**  
HOME MODELS WITH SPEAKERS, PRO touring pianos with terrific actions, and affordable yet realistic tabletop modules — this feature-by-feature chart has the lowdown on dozens of instruments.

### 83 DIGITAL ORGANS

TO B OR NOT TO B? WE SKIPPED THE HOME organ fun machines in favor of a features chart containing mostly B-3 soundalikes (both modules and the furniture variety).

### 93 PORTABLE KEYBOARDS

YOU'RE NOT GONNA TAKE YOUR KT-88 back to the hotel after the gig, that's for sure. But maybe a songwriting station with built-in speakers and sequencing is in the cards. Yes, it's another extensive feature-laden chart.

### 103 ELECTRONIC PERCUSSION

PAD KITS AND DRUM TONE MODULES form the backbone of this year's percussion listings, but the eagle-eyed may discern an actual drum machine or two.

### 109 DIGITAL MULTITRACK RECORDERS

BOTH TAPE AND TAPELESS RECORDING systems (but nothing that requires a computer) are detailed in this feature-by-feature chart. If you're looking to make tracks that come clean, look no further.

### 117 MULTI-EFFECTS PROCESSORS

PHARBULIZING, VERBIAGE, MULTI-SLAP, echolalia, choral hydrate — 42 programmable processors compared in a feature-by-feature chart, plus a list of all the preset and specialized effects we could find (omitting only stomp-boxes).

### 135 MIXERS & DAT DECKS

PRICE LISTS AND BASIC FEATURES ON 8-BUS mixers and both portable and pro DAT decks.

### 141 MIDI CONTROLLERS, PROCESSORS, RETROFITS, STANDS, & CASES

NOT JUST MASTER KEYBOARDS BUT VIOLIN and saxophone controllers, slider boxes, and Thunder and Lightning. Plus mergers and patch-bays, ARP and Moog retrofits, and — you guessed it — a truckload of brand new bags.

### 153 SOUNDWARE

CDs, CD-ROMs, FLOPPIES, AND PATCH ROM and RAM cards, broken down by manufacturer and instrument compatibility.

### 162 CONTACT DIRECTORY

WHO, WHERE, HOW — ADDRESSES, PHONE numbers, and other assorted contact info for all of the manufacturers included in this year's Buyer's Guide.

# We couldn't have said it better ourselves.

"Out of this world, exceptionally realistic, unbelievable bass end, and dirt when needed, are just some of the tired expressions that could be dragged from the cliché cupboard, because this is one mother of a synth...If you want classic analog sounds then forget the secondhand pages and buy a Prophecy, and if you want to explore virtual modeling then this is the cheapest way so far. The Prophecy will be a classic in the way of the DX7, D50 and M1." – **Future Music**

"The Prophecy is a monophonic solo instrument with a projected price that puts it into the *I gotta get one* bracket. If I hadn't been told this was a digital machine, I would have accepted the analog sounds without question. I don't think I need to be a prophet to predict that the Prophecy is going to be in demand." – **Sound on Sound**

"Love at first sight. This is a synth for the future which incorporates all the best of synths past. If you like to twist, change and control sounds as you play; if you like analog; if you like realistic emulations of brass and wind; in fact if you're interested in synthesis at all, you really have to try the Korg Prophecy. In my humble opinion, it's the best keyboard currently available in this price range – or anywhere near it." – **Making Music**

"Divine Prophecy. If you're looking for a synthesizer that doesn't only play, but that also shapes sound, check out Korg's latest synth called the Prophecy Solo Synthesizer." – **EQ**

"This is an instrument that reassures sonic originality, creativity and spontaneity at a time when recreative preset-itis has become the norm. Quite simply, this is a stunning synth." – **Keyboard Review**

"Keyboard mavens will probably love this, Korg has a hot new synthesizer...Rick Wakeman's a fan: *Occasionally, and I mean occasionally, something really innovative and exciting to play appears. Prophecy comes under that rare heading.*" – **Music Monthly**

"This little board packs a serious punch. I really liked how the data ribbon is built onto the pitch wheel...it provides a new outlet for expression" – **Memphis Musician**

"The Korg Prophecy, a 37-key synthesizer featuring Korg's DSP-based Multi-Oscillator Synthesis System, has gotten a big thumbs-up from Rick Wakeman. If you heard its wailing analog-like tones at NAMM, you'd know why." – **Musician Magazine**

**Prophecy**  
SOLO SYNTHESIZER

DSP-based sounds from classic analog synths to physical models of acoustic instruments. Ribbon controller and arpeggiator. Pitch and modulation wheels. Seven internal effects. Two

resonant multimode filters. Unprecedented expression. Find out what all the buzz is about. Play a Prophecy.

**We're changing the rules. KORG®**

If you've been following the ominous developments in these pages, you are aware of these facts: We spent the last 20 years developing the inevitable traditions — practical how-to columns, step-by-step applications clinics and hot tips features, hard-hitting Keyboard Reports and gadget shootouts, insightful Private Lessons, April Fool's gags in "April" issues that go on sale in February, the much reviled/revered Creative Options . . . December Buyer's Guides; we spent the last 11 months celebrating those traditions by running clever stories on all things real, imagined, acoustic, sampled, or synthesized that we could put in groups of 20. We also looked back on influential music and musicians in a cool series lamely titled "12 Who Count." This is the 12th and final installment of our 20th Anniversary celebration and the last chance to deliver on my promise to reveal embarrassing things about the *Keyboard* Chain Gang.

Before we descend to the depths of juicy gossip and sophomoric snickering, let's crank up the wayback machine and visit Chicago's McCormick Place, June 1975. The occasion: the National Association of Music Merchants convention, host event for a plethora of historic firsts in the land of electronic music. The unveiling of the first commercially "affordable" synthesizers capable of producing more than one note simultaneously — the Oberheim Four-Voice, Moog Music's Polymoog, and ARP's polyphonic pretender, "the Polyphonic Ensemble," a String Ensemble fed via "an innovation called Systems Interfacing" into an Axxe's filter. The release of the first digital sequencer: The Oberheim DS-2 was capable of recording a whopping 72 notes, pitch-bends and modulation gestures need not apply. Roger Powell was demoing for Moog, I believe, and had a cardboard mockup of what would become his Probe portable keyboard controller. If memory serves (and mine's often faulty), it was this same NAMM show that saw the first ever digitally programmable synth — the EML Syn-Key, which used punch cards to store parameter settings.

Ex-Moog super salesman Dave Van Koeveing debuted the Vako Orchestron, his Optigon-on-steroids answer to the Mellotron (the custom triple-manual version built for Patrick Moraz caught everyone's eye). Emmett Chapman introduced his Electric Stick to the world in the Alembic Guitar booth, and an aisle or two away a couple of guys from the Chicago Musical College of Roosevelt University, one a teacher, the other his student, tried to gather their wits and

convince the manufacturers of such things as the Hohner Clavinet, the Mu-Tron Bi-Phase, Yamaha pianos and YC-45D organs, the Fender Rhodes, Iorio accordions, and Octave/Plateau CAT synthesizers, not to mention Moog, ARP, Oberheim, and anyone else who'd listen, that *Contemporary Keyboard* was going to be a really cool magazine. Really. Trust us. Advertise in it. Please. Pretty please. Okay, buy an ad or we'll shoot this dog. . . .

Keith Emerson, Wendy Carlos, Chick Corea, Herbie Hancock, Rick Wakeman, George Duke, Jan Hammer, Josef Zawinul, Stevie Wonder . . . players we idolized. We studied their licks and longed to know how they got their sound. The notes we knew would come with years of practice, but the sound could only come from custom modular synths, tweaked-out Rhodes actions, little black ring modulator (whatever that meant) boxes, megabucks Mellotrons, things only the rich and famous could afford to surround themselves with.

*Pzzft.* Set the wayback machine to the present. *Contemporary Keyboard* evolved into *Keyboard* — a pretty cool mag read by more people than any other mag of its kind in the world. *Keyboard* is sold in more than 70 countries, translated into six languages, and we didn't have to shoot any dogs.

We now play in a world where the technological playing field is level. These days, anyone with a couple hundred dollars can get their hands on a professional-sounding instrument. Add a personal computer to the setup and you've got access to multitrack MIDI sequencing and digital recording that offer capabilities undreamed of in the mid-'70s. If you need convincing, just glance through the pages that follow in this issue. Once you do that, I'm afraid you'll be left with the notion that all we care about is gear, gadgets, and more gear.

That couldn't be further from the truth. Gadgets are simply the means to an end. That end for us is music. We'll remain committed to helping you make better music, with and without technology (like, you could hum), for the next 20 years and beyond.

Now, about those embarrassing things . . . ah, forget it. There'll be plenty of time for those during the next 20 years. But tell you what, next time you run into consulting technical editor Michael Marans, hum a few bars of "Satin Doll." The reaction will be well worth the effort.

It's been a great 20 years. Thanks to all of you for being there with us. ■

Pro Tools III™ • LOGIC AUDIO 2.5™

The best just got better!

The new TDM™ Extension unites the world's best software hardware solution available today for digital audio.

Digidesign's Pro Tools III is today's most successful harddisk recording system and the first choice platform for third party development partners that bring you a wide variety of add-on products.

Pro Tools III delivers the power of an expandable, easy to use recording system, offering a wide range of editing, mixing and effects processing facilities combined with speed and top audio quality.

LOGIC AUDIO is a fully integrated sequencing, notation and digital audio recording program supporting the complete line of Digidesign® Hardware. With its TDM Extension you will increase the power of your digital studio with the following functions:

- Plug-Ins can be fully automated
  - Insertion and Deletion of Plug-Ins during Playback
  - TDM Plug-In Configuration Editor
  - Virtually unlimited number of Plug-Ins per track\*\*
  - User definable Sends per track\*\*
  - Plug-In and In/Out configurations are saved with each song
  - Copy/Paste of any TDM configuration from song to song
  - Support of up to 48 tracks of digital audio using Pro Tools III\*
  - User definable number of Plug-Ins (Inserts) for the total Mix/Sum\*\*
  - Plug-Ins can be displayed simultaneously using their individual windows
- Full use of LOGIC AUDIO's Digital Factory™ including:**
- Quantize Engine™ to quantize Audio like MIDI
  - Groove Machine™ to regroove your Audiotracks
  - Audio Energizer™ for maximising Audio Volume without causing any clipping
  - Audio to Score Streamer™ and Audio to MIDI Groove™
  - Strip Silence to separate thousands of samples/regions with one mouseclick

## Rattle Our Cage

[As Dominic promised last month, here is freelance writer Mark Dery's frank assessment of how we're doing. Mark's byline used to appear regularly in *Keyboard*; in addition to feature articles, between Feb. '88 and Jan. '93 he wrote a column on alternative music called *Notes From The Underground*.]

Bob Doerschuk's departure is *Keyboard*'s death rattle.

What was once a lively, engaging magazine, characterized by a broadness of mind and a generosity of spirit which accommodated not only mainstream artists but the home tapers in *Notes From The Underground*, prophets of black rage such as Public Enemy, jazz iconoclasts such as Sun Ra, free spirits such as Harry Partch, and even hip-hop turntable players, is now utterly moribund. Historical overviews such as *Keyboard*'s brilliant January '87 issue on experimental music or its November '88 cover story on rap are a thing of the past, and coverage of anything outside the corporate mainstream has shriveled to World View blurbs or thumbnail record reviews — with the notable exception of the prog rock and technopop synthesists lovingly restored, through the embalmer's art, to near lifelikeness in seemingly every issue.

Given the conspicuous absence of Keith Emerson, Rick Wakeman, and other *Keyboard* staples from the culture at large, the only explanation for this morbid obsession is that the magazine, mindful of its demographic, has consecrated itself to the hallowed task of ancestor worship. That's harmless enough, though the smell of formaldehyde is oppressive and the periodic hand-wringing about "rosier times long ago," to quote Doerschuk's October '95 elegy — er, eulogy —

for Emerson, is depressive. Ironically, in this and other lugubrious asides, *Keyboard* reveals its profoundly *anti*-progressive sensibility, misty-eyed with nostalgia and blind to the vital, innovative music all around it (gangsta rap, jungle, postmodern avant-garde, and ambient techno or "chill out" music are just a few examples).

But *Keyboard*'s editorial myopia has a higher cost than cultural irrelevancy. By largely restricting its coverage to the where-are-they-now set — hilariously typed, by Tom Silverman in the November '88 rap story, as "a white guy [in] a lab coat" whose "contributions were made more than a decade ago" — the magazine is forced to rely disproportionately on advertising revenue. In such a context, there is a self-evident *quid pro quo* between the equipment manufacturers whose ad dollars are *Keyboard*'s lifeblood and the magazine's tacit assumption that an arsenal of expensive, soon-to-be-obsolete machines is a prerequisite for making music. Again, Silverman hit the target with deadeye accuracy: "*Keyboard* . . . prefers people . . . who stand behind giant synthesizer racks because it has to sell ad space to synthesizer manufacturers." The conflict of interest between critical journalism and the exigencies of the marketplace is glaringly apparent here, as is the elitism implicit in the notion that music cannot be made without a constantly upgraded array of high-priced gear — a notion which accounts, incidentally, for *Keyboard*'s desultory coverage of artists who do not require, or cannot afford, the latest in digital technology.

On a somewhat more trivial but no less irksome note, *Keyboard*'s editorial sclerosis is amply evidenced in natterings about coffee klatches and deadline crunches at "*Keyboard Central*" — anecdotes whose unabashed self-absorption

would render them unthinkable in most major magazines. It is manifest, too, in columnists who are allowed to maunder endlessly about faded glories or plug their latest releases (Dave Stewart, in particular, cries out for the editorial buzzsaw) and in the magazine's highly unprofessional practice of allowing Jim Aikin to deliver a finger-wagging sermon, at seemingly endless length, to any reader who has the temerity to cross him. Stacking the deck by allowing the writer the last word is considered bad form in most magazines.

Despite this death certificate, the extraordinary makeover of *Keyboard*'s close cousin, *Guitar Player*, by Joe Gore, Lonni Gause, James Rotondi, and the always inspired Rich Leeds offers hope that *Keyboard* may rise from the dead. *GP* makes the necessary obeisances to its advertisers, but somehow manages to strike a balance between equipment coverage and passionately opinionated reviews, Jas Obrecht's invaluable roots music time capsules, and irreverent, informative interviews with a stunningly panoramic range of artists. And while there's no dearth of gadget pornography in *GP*, Gore and his fellow editors have never lost sight of the magazine's reason for being: making music, not "making music with technology."

There's nothing wrong with *Keyboard* that a little soul-searching — and a good Stalinist purge — wouldn't cure.

In hope of a glorious resurrection,

Mark Dery  
via the WELL

## Synthesizers in the Smog

Congratulations to RLD on his new job. I've been a reader of *Keyboard* since 1977, and I have great respect for his musical and journalistic talents, but do me this one favor: Make sure his replacement not only uses synthesizers and sequencers, but actually likes them! (It will make it a little easier to take the record reviews seriously.) And you might mention to this new person, when doing an interview in Los Angeles, not to milk the smog remarks. (RLD did in virtually every interview he did in L.A. — yawn.)

Kudos on your very thorough and fair B-3 wannabe roundup [Sept. '95]. However, I feel the need to point out one inaccuracy in your article. You said, "Overall, the [Hammond Suzuki] XB-2 Version 2 accumulated the most points from our guest organists." Yet when I added up the points, it was the

# new plans from ENSONIQ

## now under construction: the 1682-fx mixer

Construction crews have broken ground for the newest addition to ENSONIQ's MIDI city: the 1682-fx mixing board. Plans call for an 8-bus board, with built-in effects from our DP Series processors, open to the public in January, 1996. *(It's just around the corner!)*

Our planners surveyed the needs of the mixing community. We studied everything from basic entry-level boards to big studio consoles that most of us only dream about. The result: an affordable board that's perfect for home studio recording, remote recording, or live sound. Big enough that you've got room to work, but small enough to fit

any 10-space rack. It's the perfect complement to your 8-track, with superb audio quality and the features you need. *(Including a lot that you won't find in any other board priced under \$2500!)*

If you're in the market for a mixer, you owe it to yourself to check out the 1682-fx. But for now, you'll have to be content with a peek at our plans. We'll show you more when we're ready to cut the ribbon. *(Your tax dollars at work - courtesy of ENSONIQ!)*

Every ENSONIQ instrument is made in America. Call us at 800-553-5151, or fax 610-647-8908. You can also try our automated fax retrieval system at 1-800-257-1439. We can even be reached via CompuServe, GO MIENSONIQ, and at <http://www.ensoniq.com> on the Web. Whew!

# Moby

MASTER OF TECHNO(LOGY)

**W**ith the early 1995 release of his first Electra album *Everything Is Wrong*, Richard Melville Hall, known since birth as Moby, became techno's first major star. The music press, long fascinated by the exotic underground techno scene with its ominous pulsating soundtrack and mythic faceless DJs, fell over each other in their rush to Moby's door. Sure, *Everything Is Wrong* is a lush, complex album far more interesting than the patchy compilations and occasional brilliant singles which comprise the bulk of the techno canon, but much more significant was the fact that Moby, unlike other elusive techno producers, did not shy from the spotlight.

A DJ/producer with immaculate under-

ground credentials (his early singles "Go" and "I Feel It" were confirmed dance floor classics long before his current fame) with a self-confessed urge to be on MTV, Moby made the ideal techno pin-up. A profile in May's *Rolling Stone* was accompanied by photographs of Moby naked, but for a strip of muslin, trussed and crucified, crowned with thorns. *LA Weekly's* laudatory piece ran under the headline "Jesus Christ Superstar." Numerous interviews emphasized his love of Christ, his veganism, his apocalyptic social philosophy (laid out in two well-written essays accompanying the CD). Techno had found its messiah and its spokesmodel.

But Moby has found his acclaim a mixed blessing, feeling increasingly trapped as a symbol of a narrow genre his music struggles to outgrow. "I don't like it when I am called a techno artist, or when people say I make dance music. The one thing I am really wary of is ghettoization, trying to compartmentalize music. On the last album there is techno and classical music, punk rock and ballads, and weird funky stuff." In fact, the prince of techno is bored with techno, preferring Nirvana or Smashing Pumpkins over anything coming out of the hard-core techno crucible. In his latest recordings, and live performances like this year's headlining slot at Lollapalooza, Moby has been cutting the brittle mechanical soundscapes of his techno with the raw immediacy of punk and the democratic abandon of live rock and roll.

Like many suburban teens, Moby was drawn to the anarchic energy of punk. He acquired a rudimentary home studio — a Roland TR-606, a Casio CZ-101, and a TASCAM PortaStudio — and began recording demos. In the early '80s he dropped out of the University of Connecticut and turned to DJing to earn a living. "The NY clubs were very eclectic," he narrates, sunken in an armchair in a basement dressing room at San Francisco's Warfield, where he was performing at the recent ENIT festival. "You could hear hip-hop and disco, punk and avant-garde rock, I played all of that." And then came house music. "House music was like a synthesis of everything I liked. It had a moodiness and a rhythmic quality to it but it also had a coldness." He invested in more equipment, including an Alesis MMT8 sequencer with which he organized his early house excursions. In techno, Moby found a genre whose severity lent itself paradoxically to emotional expressiveness. "What I like is the juxtaposition between warmth and cold. The syrupy and overtly passionate turns me off," he states with a thoughtfulness that belies his skate-punk appearance. "Eric Satie, I would say, is cold music but there is a warmth there, an emotional restraint." It is this kind of apparent paradox that marks Moby's career; he is a raver who neither drinks nor takes drugs, a techno guy who plays live with a punk band, who infuses the coldest form of popular music with an ethereal humanity. "Electronic music is really fascinating and so is human music, it is really interesting

when they are combined. What I love is hybridization, I have no time for purists."

Although he now uses Steinberg Cubase and a wide range of state-of-the-art and vintage equipment, Moby's compositional method has remained the same kind of inspired cut-and-pasting he has always used. "I've never really progressed from that original studio, I have much more equipment now, but I take the same approach." Holed up in his home studio, he plays all the instruments himself, layering rocking guitar lines over breathy synths, live drums over programmed beats, samples and effects over raw conga rhythms. "I don't even think in terms of does it sound electric or does it sound organic. I think in terms of is what's coming out of my speakers interesting to me and when someone hears it will they have some kind of interesting subjective response."

When playing live Moby triggers his samplers from Cubase, and a live drummer, bassist, and guitarist (Moby himself) play over the top of the sequences. "The computer is our conductor, but sometimes we just switch it off and jam live."

For any recording artist to achieve longevity, especially in the rapidly mutating pop/dance field, they must often outlast the genre that made them famous. As house music continues its fractal disintegration — into jungle, ambient, trip-hop, trance — Moby has chosen to distance himself from the narrow "techno" tag and carve himself his own niche on the frontiers of pop.

## Jonathan Cain

### THE JOURNEYMAN'S RETURN

If the 1980s were Jonathan Cain's years to roam (he globetrotted with Journey during much of the decade), then the '90s have been his time to drop anchor and work at home. If you could see his digs, you'd understand why. Cain's hilltop studio is a dream. Cherry red grand piano, racks of outboard gear, synths galore, a killer console transplanted from the Record Plant, and a magnificent view — his cutting room beats many commercial facilities.

No surprise, the keyboardist has been cranking out songs right and left from his Northern California space. In 1994 he released *Back to the Innocence* (Intersound), a rootsy, pop-based collection that spotlighted his vocal and songwriting chops. Then came a collaboration with former Journey mate Neil Schon on the guitarist's Higher Octave jazz release. Now there's *Piano with a View*, Cain's foray into the instrumental piano jazz waters (also on Higher Octave).

"I burned out on the whole synth-pop thing," he says, reflecting back on the end of the '80s. "I wanted to get back to my roots. So I kind of detoxed for a while and jumped back into the piano. That's what I consider to be *me*." Cain also took the opportunity to upgrade his home studio. "I built the new studio and decided I was going to go with my own songs . . . and the songs started coming." Everything he wrote, though, was intended not for publishing houses but for himself. "I gave up trying to sell my songs because, for one, I had the good fortune that the Journey catalog was doing well, and that gave me an income."

Trying to get work in Los Angeles wasn't as easy for Cain. "I couldn't get arrested down there," he says. "They'd say, 'We think it's nice you're trying to work here, but Journey and Bad English are mainstream '80s bands. You're kind of labeled a corporate rock guy.' I couldn't even get into production situations because everyone was scrambling for work. It was a curse, but it also turned out to be a blessing." In other words, it was the fuel that sparked Cain to write and record his own albums.

"People were always asking me, 'When are you gonna do a solo album?' So it was, 'You want a solo album? Okay, here it comes.'" And with master tape in hand, Cain started shopping for a record deal. "I did a showcase in L.A., like everybody does, and they all passed. 'We like the songs, but he's too old.' It was 'Whoa! Another rejection.' And then my manager left." Fortunately, Cain's lawyer didn't give up on him, and eventually landed the keyboardist a deal in Sweden with Empire Records, from which an international solo career blossomed. Times have changed — Cain's audience is a fraction of what it once was in the Journey glory days — but his records are getting solid airplay in their intended markets, which suits this songwriter just fine.

So what question does Cain get asked most often by the media? That's an easy one: Will Journey reunite? "For the first time, we're *all* talking," he tells us, smiling. Stay tuned.

### CAREER UPDATE

**ON DISC.** Just out on East West is *Life*, the latest from platinum hit-makers **Simply Red**. Singer **Mick Hucknall** teamed with keyboardist **Fritz McIntyre** and producer **Stewart Levine**, among others, for the release. . . . **George Duke** produced *Songs in the Key of Life* (EMI), no, not for **Stevie Wonder** but for saxman **Najee**. . . . *Moving On* is singer/pianist **Oleta Adams**'s new arrival on Mercury Records. Oleta, as some of you may recall, got her first major break when **Tears For Fears** frontman **Roland Orzabal** spotted her lounge act in

a Kansas City hotel. . . . P.M. **Dawn** is back in the bins with *Jesus Wept*, their third on Island Records. "All of these are gospel songs," says **Prince Be**. "We didn't want to write love ballads. We wanted everything to have a spiritual aspect to it, even if there were images of love, sex, reality, and depression." . . . **Dixie Dregs** keyboardist **T Lavitz** recently signed a management deal with Midnight Music, and is reportedly working on a new solo album for Wild Cat Records. . . . The new release from **Machines of Loving Grace** is *Gilt* [sic] on Atlantic. According to keyboardist **Mike Fisher**, "We dragged out a Marshall stack, ran a quarter

mile of extension cord up into the Malibu Hills, and stood on the edge of a cliff." Talk about creative tracking. Visit their Web site for a sneak preview at <http://www.emerald-net/mig/>. . . . Of particular interest to **John Coltrane** fans is the mother of all box sets from Rhino Records. *The Complete Atlantic Recordings of John Coltrane — Limited-Edition Vinyl Box Set* contains 12 righteous LPs, a 36-page booklet, and a 75-minute collection of outtakes from the legendary *Giant Steps* sessions. A CD set will be printed as well. Also out on Rhino is *Just What I Needed: The Cars Anthology* featuring, you guessed it, the synthwork of **Greg**

**Hawkes**. The package includes a 52-page booklet and 40 tracks on two CDs, mostly of the greatest hits variety, but with eight previously unreleased songs as a bonus. . . . The **McCoy Tyner Trio** has released *Infinity* on Impulse Records. Joining the trio on the disc is saxman **Michael Brecker**. . . . Celebrated vocalist **Kathleen Battle**'s latest is *So Many Stars* on Sony. An all-star lineup, including pianist **Cyrus Chestnut**, graces the disc. . . . **Edward Simon**, a Venezuela-born pianist, is importing his music to the States via Kokopelli Records (Box 8200, Santa Fe, NM 87504). "If you can imagine somebody who grew up in the salsa mentality who

## THE UNINHIBITED PIANO OF

# Mario Grigorov

work took them, from his native Bulgaria to Iran, the former East Germany, Austria, and the country he last called home before his move to the States, Australia.

"I used to be criticized for playing too many notes," admits Grigorov. "But now that's *me*. It's the result of what's been given to me, and it's given me the maturity and responsibility to not abuse my technique, but to use it. If a piece doesn't need it, it doesn't need it."

Grigorov attributes most of his remarkable hand independence to his study of Chopin, Rachmaninov, Czerny, and percussion. He studied orchestral percussion during his conservatory years, and a new world of drumming opened up to him when he worked with rock bands such as Split Enz. "I was playing keys with those bands, and the percussionists would teach me things. But boogie-woogie is the best medicine for the left hand," he emphasizes. Even away from the piano, his hands continue to collaborate: He sketches with both hands simultaneously, working symmetrically or independently on a single drawing. (He executed the accompanying self-portraits with a single hand, however.)

Besides his affection for odd meters, there are abrupt modulations, chromatic detours, and dance-like rhythms in Grigorov's compositions that would be easy to attribute to an Eastern European upbringing. He grins and dismisses this notion as "marketing crap," but acknowledges the importance of rhythm in his approach.

Similarly, he distances himself from the moniker of jazz pianist, even though a sizable portion of his set is devoted to highly stylized renditions of standards such as "Body and Soul" and "Round Midnight," and he has accompanied such jazz giants as Joshua Redman and Wynton Marsalis. "Swing just isn't my natural conception,"

he explains. "It's so closely linked to the jazz tradition, and I know better than to try to emulate that style. I've played a lot of bebop, but that's not where I want to head."

Jazz or not, improvisation is integral to Grigorov's performances, and he loves to take jazz tunes and apply his ostinato technique to them. "It's much harder to improvise with classical music," he notes. "There's so much in it that there isn't any space to fiddle with it. Jazz has a tradition of taking pieces and playing them your own way. Otherwise, there's no progress in music."

He also composes pieces that are fingered symmetrically in their entirety. He came upon the idea by reversing the keyboard of his Roland JD-800. "It's funny," he reflects, "When an idea first comes to you, it seems like a joke. I find that I'm insecure, like it's a childish thing to come up with new ideas. But what you have is a fantastic new tool for writing."

Such pieces are not represented on his debut release, *Rhymes with Orange* (Reprise), but you certainly get a sense of Grigorov's pianistic universe from it. And talk about success stories. On his third day after moving to Los Angeles, producer and pianist Bob James overheard him trying out keyboards at a music store. They hit it off, Grigorov played a few more compositions for James, and a couple of days later, he found himself with a major label contract.

No surprise. Success has found the 32-year-old wherever he has lived around the world, which he explains partly as a result of his openness. "A very good jazz player once commented to me how amazed he was at how uninhibited I am with my approach to the piano and to music," he says. "I've kept that thought to remind myself that I always want to open myself to being uninhibited."

—Ernie Rideout

## SWEET DREAMS

JIM WILSON (A.K.A., THE LITTLE WOLF BAND) BLENDS HIS CHOCTAW AMERICAN INDIAN HERITAGE WITH AN AFFINITY FOR THINGS HIGH-TECH ON *DREAM SONG* (TRILOKA). ACCORDING TO HIS PRESS RELEASE, THE RECORD IS A "SPIRITUAL JOURNEY WITH MODERN INTERPRETATIONS OF TRADITIONAL SONG IDEAS." "I HAD A SERIES OF DREAMS AND VISIONS ABOUT THE SONGS," WILSON TELLS US. "THE IDEA WAS TO DO A CONCEPTUAL ALBUM ABOUT NATIVE AMERICAN SUBJECTS." TO REALIZE THAT VISION, HE SAMPLED AND MANIPULATED SUCH SOUNDS AS CRICKETS, HOWLING WOLVES, AND THE FLAPPING OF BIRDS' WINGS, AND WOVE THEM INTO BEDS OF SYNTH LAYERS, PERCUSSION RHYTHMS, AND VOCAL CHANTS. PRIOR TO *DREAM SONG*, WILSON COLLABORATED WITH ROBBIE ROBERTSON ON THE SOUNDTRACK FOR THE MINI-SERIES *THE NATIVE AMERICANS*.

## KEITH'S CURE?

Much has been said about Keith Emerson's hands of late, and readers continue to write us regularly asking about his progress. It may be too early to declare victory, but Keith made an apparent stride forward after checking in with Kate Montgomery, a San Diego-based muscle therapist. "I worked on him for about two hours," she tells us, "and in that time-frame he went from a grip strength of, say, a seven to a ten in a matter of 30 seconds." What magic spell did she cast to cause such progress? The answer, according to Montgomery, is detailed in her book, *Carpal Tunnel Syndrome — Prevention and Treatment, a Non-Surgical Approach* (Sports Touch Publishing, Box 221074, San Diego, CA 92192-1074). A video from Montgomery should also be in stores by the time you read this. "What's sad about Keith's situation, and what I want to say to all musicians," she conveys, "is he didn't need the surgery. He has a lot of things that need to be dealt with, but he will be okay."

## D'ANGELO

"I think a lot of the future will point to the past," so said super producer Jimmy Jam in September's *Keyboard*, and he could have been talking about D'Angelo. A 21 year old from Richmond, Virginia, with a gospel background and a hip-hop attitude, D'Angelo's debut album for EMI, *Brown Sugar*, may set a new standard for R&B production. D'Angelo, who wrote, produced and played most of the instruments on the album himself, manages to blend the spiritual fervor of classic soul (Donny Hathaway and Marvin Gaye spring immediately to mind) with the booming drum and bass of contemporary hip-hop without merely recycling standard funk riffs à la Doctor Dre. Eschewing the layered Yamaha synth chords and overstacked snare drums that have come to dominate recent R&B and hip-hop (thanks to endless derivations of Teddy Riley's winning formula), D'Angelo achieves maximum effect with minimal production (even calling on Tribe Called Quest's Ali Shaheed Muhammed, a master of understatement, for programming help on the title track). The timeless simplicity of D'Angelo's compositions is underscored by the pared-down production which foregrounds a selection of retro keyboards over a backdrop of warm electric basslines and punchy 808 drum loops. D'Angelo originally recorded the entire album on his four track at home and even after landing a major deal with EMI and re-recording at Battery studios in New York he was meticulous about retaining the spacious, raw feel of the original demo. A series of highly acclaimed live shows has further enhanced his position as a champion of what we might call organic soul; seated center stage at a battered Fender Rhodes, backed by a selection of session heavyweights, with not a DAT or sampler in sight, D'Angelo's live shows offer undiluted soul to an audience weaned on deafening rap PAs and ersatz lip-synced extravaganzas. With the buzz building on his current album (the "Brown Sugar" video is on heavy rotation on MTV and BET) and a production deal with East/West Atlantic to produce other acts, D'Angelo might just be the young man to bring the grit(s) and gravity back to '90s soul. —Casper Melville

## Nick Milo

WITH TOWER OF POWER

## ROAD REPORT

Nick's touring rig: Hammond XB-2 atop Kurzweil PC88, K2000 at right. Rack contents include Dynacord CLS-222 Leslie simulator, Mackie 1604 mixer, JBL compressor, Furman power/light module, and MX8 MIDI mapper.

**F**or the past three decades, Tower Of Power has been blowing their inimitable brand of Oaktown soul from pole to pole. Although members have come and gone over the years, this is one Tower that refuses to fall. See for yourself — or if you can't catch them on their current tour, grab a copy of *Souled Out*, their latest on Epic.

The '95 lineup features a core of original members (bassist Rocco Prestia and horn-playing legends Emilio Castillo and Stephen "Doc" Kupka), three mid-termers (keyboardist Nick Milo, lead saxophonist David Mann, and guitarist Carmen Grillo), and a slew of newcomers (singer Brent Carter, drummer Herman Matthews, and horn players Bill Churchville and Barry Danielian). Nick Milo, a music major from the University of Illinois, has held Tower's keyboard chair for the past seven years.

**Getting the Gig.** "I was out on the road with Maria Muldaur [in 1988], and I ran into the band. I'd met the horn section previously on the road opening for Huey Lewis and the News [with Bonnie Hayes], and Emilio said to me, 'What are you doing here? I've been looking for you for two weeks.' They'd been without a keyboard player for about six months. Emilio gave me a tape, I did a soundcheck, and after that they said I could play the gig that night. There were no charts, just the tape, and that's the way I like to do it 'cause there's no middle man. So I did the gig and they said, 'Come to New York for four nights at the Bottom Line.' At the end of the second night Emilio said, 'Get your passport together, we're

going to Korea next week.' I've been in the band ever since."

**Organ Grinder.** When Milo first joined Tower, Castillo suggested he shelve the organ and concentrate on other sounds — which he did, for a while. But, well, it's hard to keep a good organ down (no pun intended). "I think Emilio was trying to develop a new sound for the band at that time, but because the organ and the feel of the B-3 is so integral to this music, I began to incorporate it more and more into my playing style. I think it became evident that the music needed it." *Souled Out*, co-produced by Jeff Lorber, is rife with Hammond (give "Taxed to the Max" a spin). And that's not the only wood-paneled oldie Milo hauled into studio: Check out his smooth Minimoog solo on "Keep Comin' Back."

**Less Is More.** The thought of touring with a B-3 is enough to send most crew members scrambling for the nearest chiropractor, so Milo chose to take the less obtrusive Hammond XB-2 on the road (see photo). He has a bigger keyboard setup at home, but he likes to keep things as minimal as possible when touring. "With this band, you don't need a lot of thick pads," he says. "It's important to have everything cut through, so I go for more of a percussive approach. I use a lot of Kurzweil piano samples, clavinet, and some analog-type sounds. When I first joined the band I was trying to make thicker textures, and one thing I discovered is: Keep it simple. It'll cut through better. So I pared everything down."

## BEAM ME UP

Body English, the essence of moving and grooving to the beat, can now be used to enhance one's music thanks to the Dimension Beam, a new infrared light beam device that allows musicians to use their arms and other body parts to generate MIDI data. It's the latest in a continuing lineup of interfaces developed by Interactive Light, a Santa Monica-based company devoted to creating interactive light controllers for games, live performance, security systems, music, and so on. The Dimension Beam radiates a tightly shaped infrared beam in which players place their body parts or objects. Depending on how the Beam is configured, it outputs a variety of MIDI information, from note numbers to continuous controllers. "The beauty of the Beam," says Vince DeFranco, inventor and product manager of the product, "is that it doesn't replace anything — it merely adds to it. Musicians who've tried it proudly brag about 'getting into their music.'"

# The Young Gods

**DON'T NEED NO  
STEENKING GEETARS**

**H**ailing from Geneva, Switzerland, and with six records to their credit, the Young Gods are known the world over as the quintessential guitarless guitar band.

Huh?

That's right. They sound as big and bad as an army of six-stringers, blasting their riffs through Marshall stacks, but there are no guitars onstage with the Young Gods. No Marshalls either. Just three guys and a sampler.

Two samplers, actually. With eyes closed, you'd swear the swarm of chugging riffs was coming from a plankman's pick, not from a keyboardist's fingers. The Young Gods are masters of deception, and proud of it.

"At first I was a guitar player," says Franz, the Gods' Trent Reznor, "but I got tired of playing and singing. I wanted to experiment more with sound. So my first approach to sampling was a practical one." With two Electro Harmonix Super Replay sampling stomp-boxes (four seconds sampling time, max), he launched what would become one of the most revered sample-based bands of the underground. "It was fun," says Franz of the early '80s live shows. "We had a Walkman, left and right out. On the left side we were loading sounds in one of the Super Replays, and with the other side we were feeding the second one. We had two keyboards, Sequential Pro Ones; they were triggering the Super Replays with CV and gate out. So between songs we had to put the Replays in record, assign which notes went in, then [he sings: 'weeeaaaaa'] and you could hear it on the P.A. 'Both sounds in? Okay. One, two, three, four. . .'"

After a dozen or so gigs with the Super Replays, the Gods upgraded. First came a Sequential Prophet 2002 sampler, then an Akai S900. Franz went hog wild with the new machines, grabbing source material ranging from Hendrix to the Stooges to Stravinsky, and at the same time started sampling himself on guitar. The Young Gods' self-titled debut disc (1987), a fusion of classical and metal, was named album of the year by *Melody Maker*. Four albums followed (*L'eau Rouge*, *Play Kurt Weill*, *TV Sky*, and *Live Sky Tour*) and now they're on the road in support of their sixth release, *Only Heaven* on Interscope, which sounds like a creepy cross between U2 and Nine Inch Nails.

"The way we worked for this LP was different than the rest," Franz

The Gods, from left to right: Franz, Üse, and Alain.

tells us. "We bought some gear, like a Macintosh and [Digidesign] Pro Tools with eight tracks. We went to regular studios to record drums, guitars, and basses — just to record some very basic grooves. Then we went back home and edited those on our system. We made loops out of the drumming, loops out of our guitars, and then went back to the regular studio to make more layers of sounds; just more experimentation."

While Franz sticks to the role of singing frontman on tour, and Üse plays live drums, Alain is the man who cranks out the majority of sampled decibels onstage. Stationed behind an Akai MX-76 controller (MIDI'd to a pair of Akai S3200 samplers), he triggers one-bar loops with one hand while playing the in-between nuances and solos with the other. No tapes, sequences, or clicks are used live.

When asked how Western audiences are reacting to a "guitar" band with no guitars, Alain jokes, "They don't talk to us." Franz adds, "I heard a story about this guy who really liked *TV Sky*, but he never read the credits; he didn't know it was sampling, and he really got disappointed when he saw us onstage. But I think this is stupid because music is music whether there's one guy playing guitar, two guys, or if it's played on keyboards."

# Introducing Cakewalk Pro Audio™.

You heard right. The world's leading MIDI sequencer now lets you record, edit, and play digital audio and MIDI in one integrated environment. So you can record vocals, guitar leads, or any other audio along with your MIDI tracks — and play them back in tight synchronization.

## Only \$399.\*

Cakewalk Pro Audio is the MIDI and digital audio workstation for Windows. It combines pro-level MIDI sequencing with multi-track digital audio technology. So you get the best of both worlds.

Unlike other digital audio systems, Cakewalk Pro Audio doesn't just support expensive audio hardware. Its scalable architecture lets you record CD-quality digital audio with a wide range of Windows sound cards, *and* the Digidesign Session8™. Cakewalk Pro Audio's Turbo Mixer™ technology drives your Windows sound card to new levels of audio performance. You can do graphic and parametric EQ, cross-fades, mix-downs, and other audio edits quickly and easily.

But listen up. With over 50 new features, the next generation of Cakewalk software brings more than digital audio to your desktop.

Use new "clips" to build visual song structures freely, without measure and beat boundaries.

Now your printed scores will look even more

polished. Cakewalk Pro Audio's staff notation supports dynamic markings, expression text, enharmonic spellings, and even guitar chord grids.

# TRENT REZNOR

EXTREMIST...GENIUS

BY GREG RULE PHOTOGRAPHY KEVIN WESTENBERG

His lyrics aren't exactly the stuff Hallmark cards are made of, and he might not be the type of guy Mary Ann brings home to meet Mom and Pop, but Trent Reznor — for all his darkness, for all his angst, for all his foreboding evil vibery — is arguably the most beloved and vital keyboard icon in rock music.

Let's qualify that. By "rock" we're talking the heavy side of the genre. Whatever label you choose to hang on Trent's music, be it metal, industrial, or hardcore, you must admit, the only thing predictable about Nine Inch Nails other than raw power is unpredictability. From grating, grinding power riffs ("Head Like a Hole," "Wish," "Mr. Self Destruct") to liquid synth bass grooves ("Closer") to militaristic forays into odd time signatures ("March of the Pigs"), no one does it quite like Trent.

*Keyboard* has profiled Trent twice in the past (Apr. '90 and Mar. '94) and both times received bundles of mail. A few readers wrote to complain about his razor-sharp tongue, but most sent letters of gratitude, citing the Nine Inch Nails mastermind as their guiding light. For that reason, along with the fact that he has almost singlehandedly saved keyboards from extinction in rock, we're pleased to include Trent Reznor as the final artist in our 20th Anniversary "12 Who Count" series. ►

and EQ, Korg Wavedrum, Kurzweil K2000, Mackie 32-channel 8-Bus and LM-3204 mixers, Oberheim Xpander, Peavey Spectrum Analog Filter, Roland Super Jupiter, R-70 drum machine, vintage Roland Vocoder, Sequential Prophet-VS, TASCAM DA-88, Waldorf MicroWave, Yamaha VL-1m, and Zoom 9050 effects processor.

Here, then, is round three with Reznor. As before, he gave us mouthfuls of quotable material. This time, however, the focus was on the state of technology, his celebrity status, censorship, his new studio setup in New Orleans, and his future projects (including a possible venture into the music software business). As an added bonus, we've uploaded the electronic version of this interview, along with some audio clips of it, to our Web site. Tap in at <http://www.keyboardmag.com/keyboard> and hear the quotes directly from the horse's, er, *human's* mouth. Enjoy.

Now . . . where did we put that garlic necklace Trent gave us?

---

***People who know you only through your records, videos, and stage appearances perceive you as a deep, dark, troubled individual. Are you really as angry as your public image suggests?***

Right [*long pause*]. First of all, did I conceive Nine Inch Nails to be this monstrous, negative entity? No. It started from: What can I say, if anything? And I noodled around with some shit that didn't mean anything to me, but I liked the Clash so I tried to write lyrics like that: I don't care about politics and the world in general. And then I got to a more intimate level and I realized I had a lot of things I wanted to say. So I started to put things on paper, how I really felt, like journal-type entries, and it came out being about things that bothered me: I don't fit in, I'm not good-looking, I want this out of life and I don't think I've gotten it. Things of that nature. I'm not saying any of those feelings aren't things anybody else hasn't felt, but my way of exercising and expressing this frustration was through my music. And I realized that I had more to say in that department than anything else. It was also kind of embarrassing because it was right to the bone. It wasn't like Lenny Kravitz's lyrics, for example. Rock lyrics. Probably well-written. But with my lyrics, it isn't a character saying it, it's *me* saying it.

I've always been drawn to extremes, whether they be film or music or self-abuse or whatever it might be. I don't consciously sit down and think that much about it. Onstage, it is a conscious decision to not talk between songs. "How's everybody doing tonight?" First of all, that's not what I'd normally say. If I based my stage persona on David Lee Roth [former Van Halen frontman] I would feel a need to do that, but I don't. You do become an extended caricature of yourself on the stage because it's surreal. You're in front of all these people, and there's this energy, and you're allowed to do whatever you want. So it becomes this distortion. When I started out, I was really eager to talk to the press about anything truthful about my life and this and that, and then I thought, "I don't need to do that." That last thing . . . *Details* magazine, they hit me totally exhausted on tour and I was being an idiot. This guy picks my brain and I just dumped. I just let loose every bit of personal shit I never wanted to talk about. I don't need people to know that about me. They know enough about me through my music. So in the media I've now become this entity that some people dismiss as cartoonish or whatever. I've just put on a thick skin. It doesn't mean that much to me. If I thought I had nothing to say musically, and I needed some image to just become a character where I can schlock about, then I'd put more effort into it. I think because Nine Inch Nails is focused on a certain element of my head, usually the more negative regions, people get the idea that that's all there is. But it's not. Now, that's not to say I don't have a lot of problems to work out in my brain, but I don't stay in a dark room all day with a sheet over my head.

I go through phases. *The Downward Spiral* was bleak. I enjoyed the process of doing it, but where my head was at was pretty bad. And then the nature of being on tour, it's just exhausting. There's less time for reflection, and more time being bombarded with things to do every minute.

***What are your feelings on how famous you've become?***

The big thing in my personal life that's changed would be I get rec-

**A**lthough Trent has declined nearly all requests for interviews of late, he graciously granted *Keyboard* a day-long hang for this special piece. When the okay came in, we caught the first flight to Hartford, Connecticut, where the Nails were just days away from kicking off a major dual tour with David Bowie (slated to feature a nightly set where Bowie teams with Trent to play Nine Inch Nails music and vice-versa). In a gutted hotel room turned makeshift production studio, Trent gave us the goods; and, unlike the man we've all become accustomed to on video and stage, he was in a kind, gentle frame of mind. He was polite, thoughtful, and no, he didn't smash or set fire to any of his gear that day. (Shucks, we were hoping to bring home half of a Nord Lead.) "Contrary to popular belief, I'm not a vampire," he told us, grinning. "My reflection *does* show up in a mirror." Don't get the wrong idea, though. Trent was still Trent; he was booked into the hotel under the pseudonym Dr. Hannibal Lector.

Trent's traveling rig is a technologist's dream — and a hotel maid's nightmare. "We don't let the maids in," joked drummer Chris Vrenna, pointing to day-old food leftovers and piles of trash as proof. Cables, racks, and instruments were strewn from end to end. Anvil cases were stacked chin-high in the bathroom. Components of the confines included a Macintosh Quadra 950 with a 10Gb drive running Opcode's Studio Vision and Digidesign's Pro Tools (eight channels), and, in alphabetical order, an Akai S1100, Clavia Nord Lead, E-mu EIV, FocusRite compressor

**"Because Nine Inch Nails is focused on a certain element of my head, usually the more negative region, people get the idea that that's all there is. But it's not. That's not to say I don't have a lot of problems to work out, but I don't stay in a dark room all day with a sheet over my head."**

ognized now, and I never did before. I've thought about this a lot. Is it nice to have people care about your music? Yes. Is it nice to get paid for doing it? Yes. There are endless benefits, and I'm not complaining about them whatsoever. But what I personally don't long for is adulation. Nine times out of ten I'd much rather walk through the grocery store with nobody looking at me. You start feeling paranoid.

**Do you have to go out incognito or with a bodyguard?**

No, I'll never do that. I mean I'll wear a baseball hat because then I'm invisible for some reason, but nothing near the level of having to be protected or any of that shit. Nor would I ever want to become that. I'd just as soon be invisible. When I'm onstage, I don't demand fan worship, and I don't need it for my ego. It is super nice to have someone like David Bowie call you up and say, "I want to tour with you." Or, I got a really cool letter from Alex Lifeson [Rush guitarist] saying, "If you ever want to fuck around in the studio. . . ." That, to me, makes it worth it. Or to be able to call up somebody you admire and they know who you are, and they're willing to talk to you — that element of it I think is great. As well as, "Hey there's a new toy out that I can buy." You can get the piece of gear that you could never afford before . . . one that doesn't work yet [laughs].

**Now that you're very successful, and you've sold millions of records, how do you respond to people who accuse you of being a sell-out?**

I don't think I've compromised my music to try to cater to a huge audience. I think that we're the result of, I'd like to believe, talent, but also a degree of timing and luck, being in the right place at the right time. The Woodstock [anniversary] concert was a gamble. I've said before and I'll say it again: We did it because they were paying us a substantial amount of money that offset the cost of the tour we were on. So I figured, one show and we'll try to do the best we can. But when you see that guitar neck [logo] with the Pepsi thing sitting on the end, you think, "This could be a nightmare." But we went and it ended up being the biggest boost we could ever have. I thought we played shitty, but onstage I felt like we were connecting. I had no idea what chaos was going on in the mobile truck, but I felt like we connected, and it meant something to me. I felt real good when we left the stage. And I think also because of the amount of mediocrity around it, it stood out as something interesting. And after that, people recognize you everywhere. I would imagine a

**"I listen to what's popular now in rock music, and the idea of a guitar, bass, and drum band in the Nirvana mold is just so utterly boring to me. Not that there aren't good songs that come out of that, or good bands — Nirvana being one of them — but to me, to get a band together that just, 'Okay, G, D . . .' It's been done. It's been done to death. If you're going to make music, have something to say, and have some unique way to say it."**

lot of people who bought *The Downward Spiral* had no idea what was really going on there, or even liked it once they'd bought it. I would hope that it might have opened a few ears up, and if it made people think a little bit or opened their minds or at least made them angry, great. It's done more than Hootie And The Blowfish, which serves a purpose, but I'd rather challenge people to some level. And if that opens a door up for some more electronic music to not be shunned in this age of retro thinking, then I'm glad I did it.

There's a weird climate right now, because it seems like there's real confusion about the element of commerce in music — the business of it, and the art side of it. I think a lot of guys get bands together and, "What do you want to do?" "Well, we want to get signed. We want to put a record out." So, okay, they get that, they put a record out, and pretty soon they've sold records and they're famous and, "Well no, we're not a sell-out." It's a business. If you want to make music and you don't want anybody to hear it, and maintain your obscurity, don't sign a deal. Don't put a record out. Don't go into the studio. Don't waste your time and the public's. If you do, then you're acknowledging that you are in a business. You're in a business where people around you are out to make money, whether it's through you selling records, or tee-shirts with your face on it, or whatever else it is. Just acknowledge it and approach it intelligently and don't let it fuck with your art — it doesn't have to. I don't think it does.

**A crop of new musicians are citing you as their mentor. How do you feel about being a father?**

Well, now that I've turned 30 [laughs] . . . nah, I mean, it's obviously flattering. I think what Nine Inch Nails did was start from a point of reference that at one time was somewhat obscure, electronic music, and mutated into something that was similar to but different than. We had elements that the influences I was drawing from didn't have, and those elements made it more palatable. It became something that could be consumed by more people. I'd like to think I maintained integrity within that, but I by no means am standing on a soapbox saying I've created everything — that I came up with the whole concept of sequencing or distorting this or that. I know there's a degree of animosity from those super purists who say for music to be cool it can only be liked by a few certain people who are cool enough to know about it.

**Last time we talked, you were just getting ready to hit the road. Here we are a year and a half later and you're still on tour. How have you and the band been holding up?**

Pretty good. There was a time, right around February of this year, when it had gone on too long without a break. It got redundant playing the same set night after night, and there was a phase where I really just didn't want to tour anymore. Then they came up with, "Do you want to go to Australia for three or four shows and some festivals?" "Hmm, this might be kind of fun. We'll try it." And halfway through the first set the first night it was like being right back on that last week. It wasn't good. So I got busy setting up a studio in New Orleans, kind of getting a home base there.

**A permanent installation?**

Yeah. We bought a 48-track analog studio, and the concept at that early time was to get out of a real studio to do stuff in a different environment. A big lesson I learned from the Tate house experience is not to live where your studio is, because it just became an entrapment. There's a million distractions that will keep you from working — kind

of the opposite of what I originally thought. That record [*The Downward Spiral*] probably took longer because you're working and the phone rings and it's UPS at the gate with a delivery. All those kind of things happen because it's your house. So when I decided to go live in New Orleans again, I casually looked around for a temporary space to set up shop, and we found this place. It was perfect. It was real big, cheap, and that idea mutated into a more permanent installation, maybe because there aren't any studios in New Orleans that are right for what I do. What it's going to end up being is a pretty cool SSL room, an analog 48-track place, that sounds really good. It just got functional right when we left to go on tour.

**In addition to being the home of *Nine Inch Nails*, will it also be available for the artists on your label (*Nothing Records*)?**

Yeah, all the bands on the label will have access to anything in it. There are a couple of rooms to work in, another room with 24 tracks of DA-88s, Pro Tools rooms, and it could be commercial if we wanted to do that. So if we go on tour again for a year or something, we may open it up to select things. But we tried to make a place that's comfortable to work in without many distractions. If people want to clear their heads, there are different places to go, there's an outside area, and inside there are rooms with different things going on in them.

**Now that *The Downward Spiral* has been out for a couple of years, what do you think of it?**

After we finished it, I didn't listen to it for a while. I was too close to it. Then we went on tour and started playing some of the songs from it, and about midway through that tour I started listening to it again, a lot, and I was

pleasantly surprised. I thought it held up. There were some things that I'd even forgot I'd done. And about a month ago, I started listening to it again. As with everything I've ever done, there are things I wouldn't do again, but generally I'm pretty pleased with it.

**What things wouldn't you do again?**

[Pause.] When I'm working, I try to maintain a spontaneous element, and not over-analyze everything. Usually what I'll do . . . like with *Pretty Hate Machine* I knew I only had X amount of time to get that whole record done in the studio, so I had everything completely done in advance. The studio was just a formality of putting it on tape. There was very little spontaneous studio energy coming from me because I just didn't have time. One day it had to be recorded and the next day it had to be mixed, for every song. So there wasn't a lot of, "Hey let's try. . . ." The opposite danger occurs when you're under the false impression of, "Hey, we're not paying. This is a house. Let's fuck around." And you can get off track that way. We could spend a week mixing a song when it was probably good the second hour of the first day. So I try to keep an element of spontaneity going, but at the same time what I've learned to do is, do something, don't think about it, and then come back to it a couple weeks later and just listen. If you like it then, usually it's okay. So towards the last bit of that record [*The Downward Spiral*], I knew I was winding down, and I had a last little burst of energy. I did some things that didn't have that check time. One was "Big Man with a Gun" and the others were "Downward Spiral" and "Hurt." Listening to it later, there were a lot of things about "Big Man with a Gun" that I wouldn't put on there now. It fit an emotion I thought needed to be

## Dave Brubeck Young Lions & Old Tigers

*"To have a song written for me by one of the world's greatest composers was the ultimate honor." – Christian McBride*

*"Dave Brubeck plays and composes his music with the wisdom and patience of an elder, yet with the passion and innocence of a youngster." – Joshua Redman*

*"I've been an enormous fan of Dave's playing and composing, and it's been both a thrill and an honor for me to play on this record." – Michael Brecker*

*"His enthusiasm and power as a musician was a thrill to experience." – Joe Lovano*

Dave Brubeck hosts three generations of modern jazzmen premiering Brubeck's new tunes written especially for their expressions. Hear spectacular solos from Michael Brecker, Ronnie Buttacavoli, Roy Hargrove, Jon Hendricks, Joe Lovano, Christian McBride, James Moody, Gerry Mulligan, Joshua Redman, and George Shearing. The mingling on this recording symbolizes what jazz has always been about—passing the tradition down to future generations.

## TRENT REZNOR

on the record, but there was probably a better way of accomplishing it now that I've had time to look back at it. And little, dumb things about the mixes. Unlike mathematics, which is an absolute. . . . You reach the end and either it's right or wrong, and there's something about that that's beautiful. You reach the end and there's a conclusion. It's absolutely over. But if you're doing a mix or doing something creative, you don't get that "I'm done" signal. You have to learn when to say, "This is good, but could it be better?" Maybe. "Could you write a better lyric?" Maybe, maybe not. "Could you mix that better?"

**Some artists put those decisions fully in the hands of an outside producer. What are your feelings about trusting outsiders?**

I do to a degree. I think my collaborative efforts with Flood and Alan Moulder worked. I've learned that you need some outside objectivity at times. There's other times. . . . I mean, when I produce Marilyn Manson and Prick, I think I have that objectivity that the artist doesn't have. They're hearing that lyric being funny or they're hearing that one note out of tune and they might be missing the big picture that this is a statement.

Like on the Prick album, Kevin and I worked on four of those tracks in my bedroom when I was doing *Broken*. We sat and messed around with four tracks of Pro Tools running Studio Vision, a couple of keyboards, and a DAT machine, and it became a challenge of, "How can we arrange this music with these limitations?" It was one mic in a room, and if there were background vocals it was me yelling from the other side of the room, and mixing everything destructively — mix these down to two tracks and keep going — and we ended up with four songs. So four years later, ironically enough, signed to my label, he worked with other producers. And when we were assembling the record, just for the fuck of it I put the old mixes up and, technically, they weren't mixed good, but there was some sort of energy spark there that was way better than the other ones that took days trying to recreate the accidents that occurred there.

### Accidents?

Studio Vision at that time couldn't play back as many cuts as I had in this one part through the [Digidesign] DAE, so it for some reason would put this thing up an octave and skip through another section, and it became a hook that if it wasn't in there the song didn't sound right. So on the album we ended up using the original mixes. I was trying to explain to Kevin when those elements of magic occur, take advantage of it. Bob Clearmountain might be pissed off when he hears that album, but nobody else cares.

**Chris (Vrenna) said Bob Clearmountain was screaming for aspirin after he mixed you at Woodstock.**

[Laughs.] That was our thing in the studio: "Would Bob Clearmountain hate it?" "Yeah." ►

**W**here have all the features gone? - Same place as the audio quality! In order to make consoles more price competitive something had to give. But try telling that to Soundtracs. They've used their years of experience in console design to create a range of cost effective mixers that lack for nothing in terms of features and performance.

Consider the Topaz Macro, a traveling compact mixer designed for gigging bands, larger clubs and stereo recording. Inputs? You get 10 ultra low-noise mic/line and 4 stereo. All easy to set up, thanks to on-board PFL. Then there's the EQ, 3 fixed bands of carefully chosen frequencies for expert signal shaping and tailoring. And of course you get the Soundtracs sound.

"It's good then." [Laughs.]

**Chris also said you were toying with the idea of possibly recording *Nine Inch Nails live in the studio*. What's your vision of the next *NIN* record?**

Well, it fluctuates. I'd say it'll probably end up being a hybrid, because my latest thing I'm hot to do is collaborate with some other people. Probably at the top of my list this second is Mike Garson from Bowie's band. He's a phenomenal pianist/keyboardist. We've been messing around at the soundchecks, just playing stuff, and I don't understand how that sound's coming out of his instrument. He's coming from a place that's far removed from me, but kind

of how I used Adrian Belew [guitarist] on the last record I'd love to feed him some of the things like that. I'd like to work with different groups of people for different ideas. The idea of live is intriguing because I've done every record pretty much based on the same format of programming. I like the idea of doing a record that is performed and then treated maybe in an Eno fashion. I listen to what's popular now in rock music, and the idea of a guitar, bass, and drum band in the Nirvana mold of music is just so utterly boring to me. Not that there aren't good songs that come out of that, or good bands — Nirvana being one of them — but to me, to get a band together that just,

"Okay, *G. D. . .*" It's been done. It's been done to death. If you're going to make music, have something to say, and have some unique way to say it. To me, I look at the studio as a tool, an instrument. There's so much you can do sonically. To fall into that trap of, "To have it be real music it's gotta be real instruments or real people playing it" is complete nonsense. I like the challenge of doing a record, maybe *Nine Inch Nails*, maybe not, of it being a traditional instrumentation but seeing how far out you could get that without sounding like Nirvana.

**People wonder if there might ever come a time when we'll see you on TV, smiling gleefully, singing about a mountain stream or whatever.**

That's a hard one to answer, but if I felt that way, that's what my music would be like. Yeah. If I went through such a sudden change, though, I think *Nine Inch Nails* would gracefully bow out as an entity and I would become whatever else.

**What's the story behind the name *Nine Inch Nails*?**

It just was a name. Everyone's got their theory on that — nailing Jesus to the cross, or this and that. But it just came up. I liked it. I liked the way it looked in print, and it passed the two-week test.

**How do you think *Nine Inch Nails* would sound unplugged?**

[Grins.] I had a few theories on that. My favorite one was us onstage with our equipment, and I'd look at Chris and say, "Start the tape." He reaches over and pushes play, and of course it's not on, it's unplugged, you can see the plug hangin' there. And I say, "Start the tape, Chris," and he pushes the start button and, nothing. So we just smash our instruments and leave. [Laughs.] But I've thought about interesting ways to . . . the thought I've had is . . . I've hung with Rick Rubin [producer] a lot, who's most likely going to produce a new *Nine Inch Nails* album, because I think it's an anti-Flood-type mentality, which is good because I need to have a new change. And I know he's much more traditional song-oriented. So as a writer I've been thinking more in terms of seeing what it would be like to go in that direction a bit. And I don't mean becoming more conventional, but maybe starting with a song and then arranging it in any fashion. Just little games you play to trick yourself into things. At the same time, I also like the idea of removing those elements and seeing how far removed from a traditional song you can get and still have an element of something catchy about it.

**Charlie (Clouser, *Nine Inch Nails* touring keyboardist) programmed a batch of tracks for *White Zombie's* latest — songs that often have only one or two chords that cycle through the whole thing.**

But there are choruses hidden in there, and that's the thing. You can have one note go through the whole song, but when he [Rob Zombie, singer of *White Zombie*] starts singing

# TRENT REZNOR

"More human than human," that's the chant-along chorus. Most of Ministry's songs are one riff for as many bars as you can stand it, but it's still catchy because it does relate to something, as opposed to, say, some vintage Skinny Puppy where there is no element of . . . what you think might be a chorus never comes back, which I think can be either rambling nonsense or an interesting format. I'm into songs that are breaking out of that mold that I've fallen prey to: verse, chorus, verse, chorus, bridge, solo section, chorus, chorus. Almost every one of my songs fits that same structure. I heard a track by the band Shudder To Think and I thought, "What in the fuck? The meter's weird.

Nothing repeats until the very end where there's this little chant. It's fuckin' cool shit." So I went out and got the record. The structure of that was weird, but it worked. Another thing . . . Bowie was an influence during his *Low* period. That was a big influence on *The Downward Spiral* from a point of, not only the mood and the desperation that it had, but structurally the songs are bizarre. One might not have any vocals, but you don't even realize it. You didn't even miss it. Or there's another one: verse, chorus, fade out. Just things like that where they break up that tried and true formula. Or odd tempos. I like watching people who aren't musicians trying to bob their heads to "March of

the Pigs," and they can't figure out why they keep getting off.

**"Closer" was a big hit despite its hook line ("I want to fuck you like an animal"). Did it bother you when you heard that song being played with the f-word bleeped out?**

That song kind of came about . . . it just started with that line, and then the music built itself around that. That was the scariest song to write, because there would have been a time when I wouldn't have allowed myself to be that obvious, because I would have been afraid that it wasn't tough enough, or it was too disco. When I was writing it and I came up with that bass line, I thought, "This is so obvious, but fuck it." I mean, if you listen to the whole album, that song, musically, is the most digestible if you're trying to pick a single, but it's also crippled from the start because of the chorus. But I'm not going to change it to try to make it a single.

**So do you think bleeping the f-word was the best solution?**

On one hand, yes. I mean, I saw somebody's little kid singing it, a five-year-old kid. And I've got to question my own intentions in that department. But aside from that, what I've tried to do is subversively sneak some things in. I realize we have a pretty big audience now, so how can I take that position and slip some things in that are potentially dangerous ideas? Not to decay the moral fiber of America, but to have something of substance to think about other than just fluff. With all this controversy about song lyrics, I was surprised that we didn't get blasted sooner than we did. But their own idiocy and lack of knowledge crippled their argument. I would find lyrically a lot of the things on *The Downward Spiral* more dangerous than the gangster rap stuff.

But when the song started to take off, it surprised me. What I hoped would have been a higher art thing became a frat house, date-rape, strip club anthem thing. Sad. I mean, it is an ugly song, no doubt. It's not nice. It's not life-affirmative. It's probably the ugliest on the record, which is why I dressed it up in nice easy-to-listen-to music. A nice juxtaposition to the lyrics. But as culture moves on and people become less inhibited by religious oppression and are encouraged to think for themselves — if people get over the silliness and the tools and mechanisms of organized religion that are used to invoke fear — things would be a lot better. It's something like the primitive stage the Internet's at now. Just to have information available to anybody anywhere that's non-governed and non-censored. You can find things now that your library doesn't have that's current and it's on every computer. It soon will be on every TV set. It's going to open people's minds up to more things. I think censorship has been causing a lot of problems in a lot of different departments in terms of human evolution. But, hey, that's what this country is based on — the ridiculous right wing, keep you in line, don't think too hard mentality. ►

## A new powerful, lightweight 76-note controller from FATAR! STUDIO-1176 KEYBOARD CONTROLLER

Ergonomically designed top panel for ease of use.

You asked for it, you got it! The new Fatar Studio-1176, 76-note, four-zone, hammer-action keyboard controller with aftertouch is now available. Studio-1176 is a powerful, very portable controller measuring 45-1/2" x 13-3/4" x 4-1/2" and only weighs 41-1/2 lbs. The ease of use of the Studio-1176 is the key to getting to your music faster. The software of the Studio-1176 covers all the parameters of MIDI, and is based on its predecessor, the Studio-1100, which has received great reviews for "ease-of-use". MIDI users will find the learning curve of the Studio-1176 to be practically non-existent.

The learning curve on some of the other controllers on the market can easily get in the way of your music. With the Studio-1176, however, you can be up and running, sounding your very best, in a matter of minutes. In short, Studio-1176 gives you the feel, the power, portability and ease of use you want and deserve from a controller.

Call Music Industries at 1-800-431-6699 to find out where your nearest Fatar dealer is located. Then try the fantastic Studio-1176. We're certain you'll be very impressed with the way it performs. Fatar also has a full line of keyboard controllers at every price-point for all musical applications.

## TRENT REZNOR

**Speaking of the Internet, what are your feelings about multimedia, be it CD-ROMs, enhanced CDs, Web sites, and the like — do you plan to dive in?**

I've done quite a bit of thinking about that; we've had a couple of propositions from different CD-ROM-type multimedia people. So I did my degree of research of just checking out what's out there now, and I've had some conversations with Todd Rundgren, but, you know, as forward-thinking as I want to believe that I am right now, I approach that with a real degree of hesitation because I haven't seen any that I think are good yet. And I blame that on where the hardware is today. Everybody seems to bring commerce into it. To make it worth your while to produce it, it should run on a machine that's mainstream enough to warrant putting it out, which means the incredibly shitty Sega-CD systems or a PC. I don't think anybody wants to listen to music on a computer, or go through the hassle of having to have a couple thousand-dollar computer just to do what? To see a flickery, shitty-looking video along with some lyrics? I haven't been impressed with the ones I've seen, although I haven't seen the EBN [Emergency Broadcast Network] one yet. I like the idea of it, but that also brings up another element of: Do people really want to interact with music, or do they just want to listen to it? The idea of an interactive movie where you actually control some degree of what's going on, that seems a bit closer to me than, here's a CD where you can remix some of the tracks and you can do this. Todd Rundgren's is an interesting one, but I can't imagine fucking with it for more than maybe a couple of hours. With a record, I can listen to it in a car, or I can put it on and it does the work for me.

The most interesting one we had presented to us was a demo by a company in England called ESP, and it was for the Philips CD-I, which, again, is another failed platform. But you put this in, and it actually hacks into the operating system of the unit, so everytime you run it, it's different. What's really in there is several videos, and there is going to be an interactive interview with me where you could type in words, and I'd respond if it could recognize the text. And if you asked me irritating questions then I'd give shitty answers, and finally just leave. What they tried to do was put an element of chaos and personality into this disc, so maybe the joystick this time went in the opposite direction, or it would be difficult to control, or different buttons did random things. You didn't know what all was on there, so I thought it was an interesting way to add depth to something.

If it gets to the point where everybody's television set has a CD player hooked up to it, and they can put a CD in and see full-frame, full-motion video with no lag time, and good audio coming out of stereo speakers, anyone can get it, they're as common as CD players, then that will be the time to seriously consider the medium. When I pointed that out to Todd, he said,

"Yeah, but someone has to be there in the interim. There are shortcomings, but someone has to do it." And I agree with that, but I have such a level of perfection to what I do that I'm not comfortable with it yet. Now, at the same time, I've always been fascinated with video games, and we are involved with the guys who made *Doom*, id Software. They're making a new one that is a *true* 3D world. Like all the other games, it's totally politically incorrect, gory and violent and scary. We met up with them, and I'm involved in the actual sounds for this environment — which is not music, it's textures and ambiances and whirling machine noises and stuff. We tried to make the most sinister, depressive, scary, frightening kind of thing. You'll be able to hook hundreds of people up together over the phone lines and see each other walking around, kill each other, *et cetera*. That's an interesting little side project that, I think, works really well with the technology that exists. It's been fun.

**Are you going to launch an official Nine Inch Nails Web site?**

We're working on a Web site for Nothing Records which will be primarily a database of information on all the bands, with lots of links. But there's a kid who's set one up out of Florida, and it's pretty impressive. We're just going to hire him to work for us — mutate his to be a real one. Part of the reason of commerce is that there will be merchandise available through there. That's the business reason to justify it, but my main reason is just as a source of information. Hopefully this will help us get rid of 98% percent of the false information that seems to be circulating about us.

**Like whether we can see your reflection in the mirror?**

[Laughs] For starters.

**We've heard rumblings about you possibly getting involved in music software manufacturing. What's that all about?**

Charlie [Clouser] and myself are talking about starting a software company to put out some very specialized DSP-type software, maybe in the form of plug-ins, but more likely mini-stand-alone applications like Sound Hack. Little things. Ways to fuck up, degrade, and mutate sounds that aren't real commercial. Weird stuff. We found ways to destroy sounds, like taking the sample rate down to 2 bits, that you're not able to do in [Passport's] *Alchemy* or [Digidesign's] *Sound Designer*, and weird modulated things where you can really get shitty sounds. Maybe we'll incorporate, say, 30 of our favorite destructive processes — again, Bob Clearmountain would have no use for this [laughs]. Stuff like, "What if you took this and reduced its dynamic range down to zero?" Or, "What would happen if you took the sample rate down to this?" Whatever. We're collecting as many ideas as we can.

**Have you set any solid goals or a time-frame to realize this?**

We're just talking about it right now — think-

# 30 Years of Sound. DigiTech Brings it Back.

**1966**

DigiTech's technological advances brought you the Vocalist, the S-DISC® and the GigaVerb.

**1996**

Now DigiTech proudly introduces the RPM-1 Leslie Simulator.

In our opinion, its state-of-the-art algorithms and tube preamplifier make it the most realistic Leslie Simulator in the world.

Would you expect less from a technological innovator?

The RPM-1 is a vacuum tube rotary speaker emulator that offers classic sounds with unprecedented flexibility and control. Designed for discerning keyboard and guitar players, the RPM-1 blends the best of analog vacuum tube and digital custom VLSI technologies.

DigiTech has duplicated two essential elements of the original sound. The first was the natural warmth and expressiveness of the vacuum tube preamp. To keep the sound authentic, the RPM-1 uses the same crossover frequency between the horn and rotor as classic rotating speaker cabinets and emulates the sonic characteristics of the large cabinet and horn driver.

DigiTech's expertise in pitch shifting gives the RPM-1 the unique ability to accurately emulate the second key element of the original sound; Doppler effects. The horn and rotor change speeds at different rates so the RPM-1 is designed to accurately emulate the natural Doppler by giving you the control and the same flexibility you had on the original cabinets when you had to choose different size drive pulleys.

Unlike other Leslie Simulators, the RPM-1 is designed as a convenient, sturdy, rack-mountable unit. Other features of the RPM-1 include: control over two virtual microphones with up to 180 degrees of microphone separation and it allows you to fine tune the speed on the fly with a standard volume pedal. When connected, the volume pedal lets you sweep the rotational speed up or down - finding that sweet spot couldn't be easier.

# Don't be a Tape-based googlehumpher.

In 1856, Charles Darwin determined that the *Tape-based googlehumpher* species died off because of its failure to evolve with the times. 150 years later, E-mu's DARWIN 8-track Digital Hard Disk Recorder is proving to be the salvation of the digital recording species, with its highly evolved functionality and streamlined cost. It's true: DARWIN delivers the power of digital audio workstation-style recording and editing at a price every *Homo erectus* can afford.

**GOOGLEHUMPERUS  
TAPEZOIC PERIOD**  
Extinct due to its diet of magnetic tape,  
limited brain power and incredibly  
slow speed

Play music? Doing some recording? You won't believe what DARWIN will do for your creative process! That's because DARWIN's heart pumps with the power of non-destructive random access recording technology. Consider the benefits of that over taped-based beasts:

- Effortlessly cut and paste that perfect chorus throughout a tune
- Completely rearrange a composition without screwing up the original
- Instantly resurrect that insane guitar riff you accidentally wiped out
- Create a virtually unlimited number of tracks from a single unit
- Avoid time wasted waiting for tape rewind
- Operation so easy and evolved, even a dinosaur can run it

Any question about who will be picking who's teeth with who's bones in the recording food chain? Face it, you need this thing.

Don't make the mistake of the googlehumphers before you. Spit that tape out of your mouth and sail to your nearest E-mu dealer to learn about the DARWIN Digital Audio Disk Recorder in the flesh. After all, DARWIN is... the natural selection.

## TRENT REZNOR

ing about getting some people involved. No real time-frame yet.

**What do you think about the current crop of music technology?**

Well, being a gear-head, I hadn't been interested in any new stuff that had come out, as far as keyboards, with the exception of the K2000. There was the hump of everything being workstations and sounding the same, the sample-playback shit just was not interesting. However with the modeling stuff — we picked up the Yamaha VL1 after everyone said it was a piece of shit, and we borrowed it for an afternoon in New York, and I was probably the most blown away by it than with any keyboard I've met in years. I haven't delved into it far enough to know, "Oh it can only do these three sounds," or not, but... Like, I remember when I first heard a [Roland] D-50. It would have taken me five keyboards to make that sound, and that first moment it was, "Whoa!" And then you quickly realize that that's all it really can do. But the idea of organic sounds is right in line with a lot of things I've been fuckin' around with. I'm glad that somebody's put the research into a high-end piece of gear that's very non-commercial that has the ability to make some truly new-type sounds that are cool. I'm totally into that idea of technology. I also got the Roland guitar thing, the VG-8, and I think it's excellent for certain things. Just to be able to tune each string independently made it worthwhile. We were going to use it on tour but decided it probably wasn't a good idea, yet. But we used it on the new Marilyn Manson record and I think it's a cool idea, a cool concept. I think the clean sound is fantastic. If you look at it as an elaborate effects processor, I think it could succeed on that level.

**And you've got a Nord Lead.**

I've got four of 'em now. I think that is the coolest-sounding analog-type synth. I just love it. And I think it looks cool, and that's pretty much the main reason I got it [laughs]. I love that keyboard, and I know it's going to make a lot of the [analog] shit I have now obsolete — like, it doesn't go out of tune.

**What software do you prefer these days?**

I tried other sequencers, but I keep going back to [Opcode] Vision. I couldn't be happier with it. [He also wrenches Digidesign's Pro Tools daily.]

**Do you get much time to play keyboards away from the band?**

I usually have the K2000 in my hotel room, but now that I have a place to put it, I'm going to get a piano. That was a nice thing about the Record Plant, they had a piano and I could just sit down and play alone.

**Perhaps a solo piano album is in your future?**

Yeah, in a couple years when no one likes me anymore.

**You might be ideally suited to interpret, say, Cowell's "Banshee."**

Yeah, but with hammers and nails and shit all over the thing. [Laughs.] ■

# BUYER'S GUIDE Hardware

**T**hey said it couldn't be done. And they were right. (Actually, the staff insisted it couldn't be done. The boss said it could too. The boss was right, as usual.)

Our very first Buyer's Guide, in December 1990, was what we called "the phone book," a Grand Coordinated List Of Everything. In the years since, we've devoted our Buyer's Guides to more in-depth coverage of narrower product categories. After five years, though, it was obviously time for the phone book again. Trouble is, the music industry has grown in the years since — and our staff hasn't. Even the boss was forced to admit that the Grand Coordinated List Of Everything would be suicidal.

So we pared the concept down just a bit. Since last year's Buyer's Guide was devoted to music software, we turned this issue into a Hardware Buyer's Guide. Our guiding principle: If it needs a computer to operate, it's off the table. No software, and no hard/soft hybrids (hard disk recording systems, for instance) that require a computer. Admittedly, this is a disservice to readers who are interested in otherwise similar products — notably digital recorders — some of which require a computer, and some of which don't. But with the spectre of two million soundcards looming in the background, half of which have announced that they'll be adding multitrack recording in their Very Next Update, we felt we had to draw a hard line.

The editorial knife was also wielded to trim away cassette multitrack decks, since we covered those with reviews and a chart last month. We eliminated hardware such as 48-channel consoles and tape decks that are mainly of interest to large studios. Project studio gear, yes; downtown studio, no. Home organs with auto-accompaniment — nobody reads *Keyboard* to find out about that stuff, so skip it. We would have liked to cover acoustic pianos, since they're central to keyboard artistry, but two pianos of the same model, with all of the same specs, can differ wildly in sound and playability, so piano listings would have been largely meaningless.

The types of gear that we figured are central to our readers' music-making — synthesizers, samplers, programmable effects processors, digital pianos and organs, modular digital multitrack recorders — rated feature-by-feature charts. Everything else had to be relegated, with regret, to simple lists. Maybe the most important list is the list of manufacturer addresses, phone and fax numbers, and e-mail contacts; you'll find it on page 162.

Our effusive thanks go out to the long-suffering manufacturer and distributor personnel who filled out our obsessively detailed questionnaires. Many of them have products in multiple categories, and in each category

they might have from two to a dozen models. So they were receiving multi-page questionnaires from four or five different *Keyboard* editors, and having to fill them out as many as 40 or 50 times.

And it's not as if these hard-working folks have nothing better to do than look up (or test) the LFO rate range of their General MIDI modules. Many of them have bosses who assign them other tasks from time to time, and their pressing deadlines (to say nothing of business trips) don't necessarily dovetail neatly with our need to pull the completed forms from our creaking, groaning fax machine no later than the 15th of September.

Multiply this scenario by several hundred pieces of gear, and you'll begin to see why this year's Buyer's Guide occasionally falls a millimeter or two short of utter perfection. The "???" entry in the charts, for instance, means we couldn't track down the information before our deadline — possibly because the U.S. distributor couldn't get a reply from the Japanese engineering staff in time, or possibly because we were too busy harassing some other manufacturer who was a little late sending us *all* of the data on a whole line of instruments.

While we did our best to catch and fix the more glaring anomalies, we can't promise that a few errors didn't make it into the published charts. Shocking as it may seem, when filling out questionnaires (even questionnaires that are 100% unambiguous about the specific information being requested, which ours weren't, always), individuals who work in marketing departments have been known to interpret both synthesizer terminology and the features of their own gear in ways that are, shall we say, optimistic. One manufacturer's representative filled in a blank in the synthesizer questionnaire with the seemingly rock-solid information that his instrument had a 44.1kHz sample playback clock rate. He also faxed us some helpful pages from the back of his own owner's manual, however; in those pages the clock rate was clearly listed as . . . well, to disguise this individual's identity, let's just say it was less than 44.1kHz. We wouldn't want to single him out for abuse, since he wasn't the only offender.

If a fact is garbled, or missing entirely, we hope you'll drop us a line and let us know, so we can run a list of corrections in the Feb. '96 issue. But please, in the interest of our frayed nerves, try to restrain the sarcasm. If your letter begins, "Don't you hopeless bozos know that the XPC-9009 has three multimode filters per oscillator? How could your research be so disgustingly sloppy?", just remember: We still have that videotape of you and your little brother doing unspeakable things to a Yorkshire terrier. You wouldn't want it to show up on *60 Minutes*, would you? Need we say more? —*Jim Aikin*

# BUYER'S GUIDE Synthesizers & TONE MODULES

BY JIM AIKIN

**W**here would we be without synthesizers? (I don't even want to think about it.) As you peruse the synth chart on the following pages, the standard *caveat* applies. The most important thing about any instrument is what it sounds like — and you won't find that out by reading a chart. What you can get from a chart are some preliminary ideas about which instruments come close to meeting your hardware needs. If you need a built-in sequencer, for instance, you can pretty much cross off anything that says "none" in the sequencer line. If your budget tops out at \$1,500, a glance at the chart will reveal that a shiny new Kurzweil K2500 is not in your future.

An instrument's real-time responsiveness to the player's input gestures is almost as important as the sound itself — and here, a chart can be quite helpful. Check the info under "key response," "left-hand controllers," and "rear-panel control inputs," for starters. Also look under "programmable" to find out which instruments can record parameter changes into a sequencer as sys-ex data, under "number of LFOs" for real-time rate modulation, and under "number of simultaneous FX" for real-time effects modulation.

Four years ago, the synthesizer chart in our Synth & Sampler Buyer's Guide (Dec. '91) had 35 columns covering a total of 60 different instruments. This time, we had to contend with 55 columns and a total of 92 instruments and modules. A few instruments from the 1991 listings are still represented in the new chart: the Ensoniq SQ-1 Plus and SQ-2, the Korg 01/WFD, the Kurzweil K2000, the Oberheim Matrix-1000, the Studio Electronics SE-1, and the Yamaha SY99. Most have fallen by the wayside — the entire Roland D series, for instance, Yamaha's TG line, and the Korg M and T synths. At the same time, Alesis, Clavia, Marion Systems, and several other manufacturers have entered the fray.

A quick look at some items of information that may not be clear at a glance:

**Audio Outputs.** The number refers to the absolute number of analog output signals. Usually these will appear as discrete 1/4" jacks, but not always. A digital output, if available, is also noted.

**Disk Drive.** "HD" means a high-density 3.5" floppy drive. "DD" means double-density. Of the synthesizers, only Kurzweil K2000 and K2500 (which are also listed in the sampler chart, starting on page 45) offer an optional internal hard drive.

**Keyboard.** We made an effort to note the number of separate MIDI transmit zones on the keyboard, but this information is fragmentary. If the chart doesn't note the number of zones, that doesn't mean the keyboard won't transmit on multiple zones. We did distinguish between

weighted, semi-weighted, and synth-action keys.

**Key Response.** We noted velocity (V), release velocity (RV), channel aftertouch (CA), and polyphonic aftertouch (PA). With modules that have no keyboards, this category refers to the type(s) of MIDI data that the module can respond to.

**Rear-Panel Control Inputs.** We did our best to separate on/off footswitch (ftsw) inputs from continuous (sweep) inputs. A footswitch input, if present, is presumably assignable as a sustain pedal input, so it might be a good guess that "sustain" means the footswitch input is *not* assignable to other functions. On the other hand, who knows?

**Playback Clock Rate.** Several manufacturers misinterpreted this question as referring to the clock rate at which their factory waves were originally sampled, *not* the rate at which the samples are played back. We did our best to clarify the data, but we're making no promises.

**Maximum Polyphony.** The first number in this field should be unambiguous: It's the total number of oscillators in the instrument. Unless . . . what if you *have* to use two oscillators in a single patch? In that case, the number shown is the number of notes you can play at once, not the number of oscillators. The second number is the number of oscillators that can be programmed into a single single-type program.

**Programmable.** The item "RT sys-ex" on this line refers to the ability to transmit MIDI sys-ex data as a single parameter is edited from the front panel, so that edits can be recorded for expressive purposes in a sequencer. With instruments that have extensive controller input routings, this feature may not be necessary.

**Number of Envelopes.** This refers to the number of envelopes available for a single-oscillator voice, *not* the number of envelopes available for an entire two-oscillator or four-oscillator patch. At least, that's the question we tried to get an answer to. The time/level figures are given for the filter envelope, which is often the most capable envelope, or at least a valid representative, in a design where the pitch, filter, and amplitude envelopes may all have slightly different designs. An ADSR envelope has three times (attack, decay, and release) and one level. We chose this more specific method of showing envelope data to avoid having an ADSR described as a "4-stage envelope." Even so, a few manufacturers wrote "4-stage" in answer to the question "how many time parameters," and left the level parameters question blank. We're sure they're very nice envelopes, but you probably won't find out exactly how they're set up by reading the chart.

**Number of LFOs.** As with the envelopes, we intended this category to refer to the number of LFOs per single-oscillator voice. In some synths, however, a pool of LFOs can be shared by several oscillators within a voice, so the number may refer to the patch rather than the voice. The "wf" number refers to the number of waveforms (square, triangle,

etc.) available for an LFO. "RT mod" refers to real-time modulation of LFO rate (not depth, which all synthesizers have, or should). We asked manufacturers to give us the frequency range of their LFOs; not all of them provided the information, however.

**Output Routing per Oscillator.** This category describes the ability to set the various oscillators in a patch to their own pan position (set pan), to dynamically pan individual oscillators under either real-time input or LFO control (dyn pan), and to give each oscillator in a multi-osc patch its own effects send level (send).

**Modulation Routings.** This poorly defined lump of information is intended to give you at

least some idea of how powerful the modulation routings of the instrument are. We asked questions about "matrix modulation," but some instruments have dedicated matrix mod pages that allow any input to be assigned to any destination, while others may have even more powerful modulation possibilities but provide inputs on separate module pages (pitch, filter, etc.) rather than on a matrix page. "Matrix" figures are given for some of the latter instruments in the chart; what the figures mean, in this case, is somewhat arbitrary. The source and destination numbers, if present, may help you compare apples with apples and oranges with oranges.

The word "standard" means that an instrument can route LFO to pitch and probably filter,

has envelope inputs to filter and amplitude, routes mod wheel to LFO depth in some manner, and a few other things like that.

**Drum Kits.** We attempted to ascertain whether individual keys within a drum kit can be given their own filter settings, envelope (noted as "decay" or "att/dec," for instance, depending on the type of envelope parameters provided), pan position, effects send level, and multi-drum-sound layering, as well as the number of keys in the kit and the overall tuning range of each drum sample.

**Memory.** The first figure given is usually the number of Megabytes of waveform ROM; single patches and multi-type patches are listed separately.

**Number of Multi Parts.** This grab bag category describes at least one thing unambiguously: the number of "parts" (usually equivalent to MIDI channel reception slots) that are simultaneously available. In addition, we tried to find out whether each part could be given its own pan position and/or output jack assignment ("out") and/or effects send level ("FX"). Instruments that offer a voice reserve for each part, patch program parameter offsets within the multi parts, MIDI program change remapping, or an "overflow" mode (in which MIDI notes that can't be responded to because the instrument is busy are routed to the MIDI output, so they can be sounded by a second unit) are also noted.

The question of what constitutes a "multi" is not entirely clear. Some instruments have three levels of architecture rather than two: a single-patch mode, a combi mode in which four or eight patches are zoned or layered on the keyboard, and a 16-channel MIDI multi. Others may not have "combi" presets in this sense, but they allow you to link and keyboard-zone three or four additional patches within a single patch. How do they fit into our chart? Badly.

**Sequencer.** Most of the facts in this category should be obvious. "ee" refers to a screen or utility in which single events can be edited, "bbc" refers to the ability to define edit regions with bar/beat/clock precision (as opposed to bar-line-only regions) for block edits such as velocity scaling and transposition, "MC/SPP" refers to the ability to sync to MIDI clocks with MIDI Song Position Pointer, and "SMF" refers to the ability to load Standard MIDI Files from an MS-DOS diskette.

**Number of Effects.** The first two numbers in this category (such as "4/2") show (a) how many simultaneous effects the unit is capable of when each effect process in a multi-effect algorithm such as distortion/delay is counted separately, followed by (b) how many simultaneous effects the unit is capable of when each multi-effect algorithm is counted as only one effect. The latter number quite likely bears some resemblance to the number of discrete effects processors that the hardware boasts. For instance, if you have only one processor, but one of its algorithms is chorus/delay/EQ, the entry should read "3/1." The next number refers to the total number of algorithms that can be selected. Real-time modulation capability is also noted. ■

## NOW YOU REALLY CAN HAVE IT ALL.

- 8-track digital recording
- Digital mixing
- Digital parametric EQ
- Full MIDI control/automation
- And more...

The **HDR-8** goes well beyond the norm of digital recorders: it has a built in digital mixer with level, pan, digital parametric EQ and two aux sends for each track, so recording, mixing, and processing stays in the digital domain. You can merge (bounce) tracks with no loss of quality or build up of noise; recall 128 mixer settings either manually or via MIDI program change; control all mix parameters from a sequencer for fully automated MIDI mixing; enjoy total editing control over your recorded material (copy, move, delete functions), and sync any number of **HDR-8**s with only an optical cable—the same cable that sends the full digital master from one unit to the next, allowing all-digital mixing between units. The **HDR-8** is controllable via MMC, has auto punch in/out; 8 locate points per song; takes two internal hard drives, and is the most complete, stand-alone 8-track recording system you will find.

You might also find the price suprising: just \$2495<sup>™</sup>

(Also available in similar 6-track version—the **HDR-6**—call for details.)

## Darn that Dream

In the article "Near-Field of Dreams" [Oct. '95] *Keyboard* notes that Yamaha NS10M Studio speakers are "considered by many to be an industry standard," and clearly *Keyboard* demonstrates this by their choice of the NS10M Studio as the standard against which all of the other systems are judged. Of course we recognize that it is the mission of our competitors to try to unseat the NS10M Studio as the top choice near-field. I am disappointed, however, by *Keyboard*'s back-handed comments about the NS10Ms, specifically, "Although the NS10Ms seem to have taken a beating in this comparison," and "We don't mean to convey that the NS10Ms sound bad." This negative tone seems to indicate that *Keyboard* is a participant in that mission. Why does *Keyboard* feel obligated to adopt such a negative tone, instead of balancing its write-up with reasons why these speakers have been so successful over the years?

Of particular concern to us is the statement, "We will say, though, that at the end of an extended session of listening only to them, our ears were pretty tired." As you must be aware, thousands of engineers rely on NS10Ms day after day as their reference monitor. We have yet to hear from any of them that their ears get tired as a result of mixing with NS10Ms.

The NS10M Studio can be found in most major recording studios world-wide. In fact, there are more NS10Ms in service than all of our competitors' speakers combined. Why? Simply put, the NS10Ms provide a unique combination of response accuracy and ability to handle power at the high listening levels common in music production. What's more, they are affordable. All of the other systems reviewed, with the exception of the Alesis systems, cost two to five times as much as the NS10M Studio.

The use of the word "pleasant" with regard to reference monitor performance should not be taken as a compliment. Another set of monitors may sound magnificent. Unfortunately, that is not the point of a good reference monitor. By design, NS10Ms do not necessarily sound magnificent. Yet top engineers continue to trust the NS10M Studio to provide an accurate representation of what is really going to tape. It is important to these

professionals that what sounds good in the studio sound great in the real world — on home systems, in theaters, and on the radio.

Billions of dollars have been made from mixes that were referenced on the Yamaha NS10M Studio monitors. Hundreds of thousands of mixes, including the majority of mixes on the *Billboard* weekly Top Ten, speak for themselves. Quite honestly, we believe that if we even considered messing with the sound of these speakers, we would witness a major lynch mob forming in front of our headquarters, consisting of the many audio professionals whose careers depend on what they hear through Yamaha NS10Ms.

## More Whiner Nausea

I'm sick of whiners like Bill Roberts [Letters, Sept. '95] complaining about government funding for the National Endowment for the Arts. The paltry sum the NEA receives from our tax dollars doesn't even equal what the military spends on its stage bands! Tell ya what, folks: I'll gladly pay for Bill's share of the NEA when Bill pays for my share of the military budget.

Well, not in so many words. But to us, there's nothing sweeter than the sound of a critic reviewing one of our discs.

# We've Sampled the Critics!

Critical acclaim is what happens when you pour your life into a project — when you agonize over every decision until it's just right. That's the approach we take with our discs. No quick fixes. No lame recordings. Nothing goes out the door until each program and each sample has been tweaked to musical perfection. Maybe this is why every one of our discs reviewed so far has received ★★★★★ in Keyboard Magazine, most of them across the board. Spectrasonics' Bass Legends received a special 11 out of 10 rating in Recording Magazine. And Supreme Beats got a quadruple ★★★★★ rating in Keyboard, an achievement no one else can claim to this day.

So how can you learn more about ILIO's critically acclaimed products? Of course, you can call our toll-free 800 number.

But don't forget to keep sampling the critics!

The Synclavier® Sampler Library perpetuates its legendary name with high quality recordings and performances of the "core" set of instruments. And it's definitely NOT just the old stuff. We took only the best from the original library, most recorded at 50kHz or higher, and added thousands of brand new top-notch recordings for a total of over 1.6 gigabytes on five CD-ROMs.

# BUYER'S GUIDE Samplers

## BIG DAC ATTACK

BY GREG RULE

**I**t's hard to imagine an electronic music world devoid of samplers. Since their inception, samplers have redefined the way many of us make music. Whether they're used for rhythm loops, sound effects, acoustic instrument simulations, or whatever, samplers have become the cornerstone of many a production studio and stage show.

Samplers have evolved steadily — the current crop being proof positive. Priced from rock-bottom to "oh my God," samplers come in many shapes and sizes, as you'll see in the following chart.

What you won't find here, however, are samplers that rely on computers — Digidesign's SampleCell, for example. These were excluded in order for us to stay true to our "no computers" buyer's guide theme. Also excluded were sample playback units that lack audio inputs.

Before you dive into the chart, please take time to read the following abbreviations and explanations for categories that might be confusing.

**Bit Resolution.** This important spec has four parts: input, internal word size, individual output, and stereo mix outs. The internal resolution refers to audio processing (such as on-board DSP) that requires extra arithmetic headroom. An output resolution greater than 16 bits helps to produce greater fidelity, even when the sample words are only 16 bits.

**Number of DACs.** A DAC (digital-to-analog converter) is where the sampler's digital sound is translated into a signal that can be plugged into a standard audio mixer. Some samplers provide a separate DAC for each output jack. In others, a single DAC runs at a high enough

speed to multiplex — that is, it can handle several analog outputs at once. Other things being equal, the more DACs a sampler has, the better it will sound when multiple outputs are used.

**Loops.** This category specifies the maximum number of loops that can be programmed into an individual sample, and also the type(s) of loops that can be programmed. Samplers that allow two loops per sample typically use the first loop for sustaining a note, and proceed to the second loop (called a release loop) when the note-off message is received.

**Number of Envelopes per Voice.** This category seems simple at first glance, but some issues are difficult to explain in a chart. Some samplers provide both individual voice envelopes and "global" envelopes that will be applied to all of the currently sounding voices. As a result, if you're playing one note you may be able to use three envelopes, but with two notes you get only five envelopes, not six.

The number of envelope stages is also a potential point of confusion. A conventional ADSR envelope is sometimes thought of as a "four-stage" envelope — but if we consider that a single stage must contain settings for both rate and level, an ADSR has only one complete stage, the decay/sustain stage. It has two partial stages (attack and release, neither of which allows a level to be programmed).

**CD-ROM Formats.** In addition to the type of files a sampler will read (Akai, Roland, etc.) we've added three additional information bits to this category, represented by an a, b, or c. The "a" means it will read the raw samples, "b" indicates it will read the samples and key layouts, and "c" means it will additionally accept the pre-programmed voice parameters.

**Non-realtime DSP utilities.** As you peruse this category, please note that basic items — such as truncate, cut, copy, and paste — were excluded for brevity's sake.

HIGH TECHNOLOGY  
WITHOUT THE  
HIGH ANXIETY

# STRUM A SAX. TONGUE A DRUM. HIT

Mold and shape up to  
256 sounds and 128  
combinations per bank.

Maximum of 64-note polyphony gives  
you full MIDI orchestration capability.

**64 NOTE  
POLYPHONY**

IT JUST MAY BE THE MOST  
SIGNIFICANT BREAKTHROUGH IN  
SOUND SYNTHESIS TECHNOLOGY.  
INTRODUCING THE TECHNICS  
ACOUSTIC MODELING SYNTHESIZER.  
WITH THIS AMAZING INSTRUMENT,  
YOU'LL ACTUALLY CREATE NEW  
MUSICAL SOUNDS BY COMBINING  
THE DRIVER OF ONE INSTRUMENT -

Control where you strike the drum  
surface, determine the mouthpiece  
angle on a flute, etc., in real time.

# A TRUMPET. AND BLOW YOUR MIND.

Real-time expression lets you control sounds as you would physically, such as bending strings.

SUCH AS A GUITAR PICK - WITH  
THE RESONATOR OF ANOTHER - THE  
TUBING OF A SAX. YOU'LL EVEN  
INVENT INSTRUMENTS THAT CAN'T  
EXIST IN REALITY. THE NEW  
TECHNICS ACOUSTIC MODELING  
SYNTHESIZER. IT WILL CHANGE THE  
WAY YOU CREATE MUSIC FOREVER.

Imagine  
creating  
your own  
instruments.  
How does a  
saxadrum  
sound?

### Wimpy Action

Does Jim Aikin play keyboards? Does Roland play their keyboards *before* releasing them? The XP-50 [Keyboard Report, Oct. '95] is sadly missing a responsive keyboard action. In general, I love Roland gear; my ten-year-old JX-8P, which has little weights under each key, is still my favorite keyboard. Jim Aikin in general is also great; I got rid of my TV on the suggestion of one of his columns and couldn't be happier about the effect on my musical productivity. But to not mention the pitiful feel of the XP-50's action is like an automobile magazine giving high marks to a car with no steering wheel.

Bob LaDelfa  
Rochester, NY

As a new owner of a Roland XP-50 I was happy to see my purchase decision validated in your recent review. Regarding the sequencer, you can store header information in a song file; this procedure is detailed on p. 93 of the manual. On my wish list: An expansion board with all 8 megs dedicated to a single acoustic piano! As the review said, the acoustic piano is kind of weak, although tweaking the filter and amplitude envelopes improves it somewhat.

## Undead Sounds

I have had enough of people complaining that keyboards are not expressive instruments. What the hell are these people doing wrong? A keyboard can have immense expressive potential if you are willing to take the time to learn the various techniques and controllers available to you. We have velocity, aftertouch (channel and poly), the pitch wheel, mod wheel, footpedals and switches, breath controllers, and more and more commonly, ribbon controllers and sliders. This is just what is built into the keyboard itself! Countless other devices allow control over the internal parameters via either continuous controllers or sys-ex (the Peavey PC 1600 comes to mind); with these you have programmable control over an extremely large number of voice parameters. This is without even exploring the timbral capabilities of modern synthesizers, as well as the multiple methods we have for creating sound — sample playback, FM, analog, and numerous crossbreeds. Most other instruments have only one type of sound generation, and I can't think of a single [acoustic or electric] instrument where you can decide that the playing velocity will control the filter cutoff on this song, but on the next it will control volume only.

I'm not saying that keyboards are without

# BUYER'S GUIDE Digital Pianos & Piano Modules

BY ERNIE RIDEOUT

**T**he digital pianos listed in the following chart all have two things in common. One, somewhere deep in their waveform memory, they each have at least one program designed to closely resemble the sound of a piano. Two, their keys are intended to approximate the feel of a piano action.

Other than that, these keyboards offer a range of feature sets as different as the colors of the rainbow. It'd be hard to come up with another instrument type that shares a name yet fills such widely varying niches. Clarinets? Accordions? Acoustic guitars have more in common with six-stringed electrics than most

of these keyboards have with each other. Heck, some of these digital pianos wouldn't even be seen in the same room together.

This is good news. While few manufacturers or dealers would want to limit an instrument to a particular market ("ideal for home, stage, and studio!!"), you'll find that each one has a particular strength. For professional live gigging, the pickings are few but the quality is high. Inexpensive, portable starter keyboards are well represented. Many instruments have extensive software libraries for learning to play and playing along for fun. And, in keeping with the noble tradition of acoustic piano salesmanship, many are designed with your decorating needs in mind.

Most of these instruments have built-in amplification systems. This is a boon for living rooms and technophobes, since there will be a minimum of cables to bother with. Some are loud enough for close listening in a small room, others could fill a recital hall. And they all do what no purely acoustic piano can: They let you listen on headphones.

By and large, these are instruments that you'll want to set up and have them stay put. The portable ones are obvious; they're the ones with no stands and mere double-digit hefts. But the console-style cases can weigh upwards of 250 lbs. You're not even going to feel like vacuuming behind a piano of that mass.

Very few of these instruments have the ability to program sounds, to load new sounds, or to use the instrument to control an extensive MIDI rig. For the most part, they're designed to intimidate as little as possible, and limiting operating system features and simplifying the front panel is one way to achieve this.

A few digital pianos resembled synthesizers so much, they wound up on the synthesizer chart starting on page 40. Look for those with 88-key weighted actions among the 61-key synth types, and you'll find a couple more keyboards that you might be interested in.

Then there are those digital pianos that resemble little black boxes, the digital piano modules. Although these are sound modules, we felt that they'd be of greater interest to those specifically seeking quality digital piano sounds. Therefore, you'll find them on the following chart as well. As of this writing, there are only two on the market: the E-mu Proformance Plus and the Kurzweil MicroPiano. While it contains no acoustic piano sounds, the Voce Electric Piano module has been included here as well.

With the following listing of digital pianos and their kin, we endeavored to provide you with as complete and accurate a resource as possible. Because of space limitations, we've doubled up some entries that were either up-

grades of base units or similar models with slightly different features. And while the manufacturers involved worked diligently to ensure that we received accurate information, none of it is a result of our own measurements or tests. Specs are subject to change, as you know.

As for the intelligibility of the chart, it seems clear to us. But then, we've been staring at the thing for weeks. Let's take a moment to explain what information is presented in each chart category. This also goes for the Portable Keyboard chart, found on page 94.

**Manufacturer & Model.** This lists the brand name of the instrument, which may be different than the company that markets or distributes it. We've provided cross-referenced contact entries in the Manufacturer Contact list on page 162, just in case. When more than one model number is listed, all specs apply to all models, except as noted. A dash, "—," indicates that a particular feature is not available on the instrument.

**Suggested Retail Price.** This is not as straightforward as one would think. First, you'll notice that there is a fantastic range of prices listed, from a little over \$100 to over \$10,000. Nothing too hard to understand about that. But then you'll also see that about half the instruments do not have prices indicated. How the heck do you figure out how to compare features between instruments when you've no idea whether you can afford them or not? Good question.

Some manufacturers do not publish, or even establish, retail prices for some instruments. The price you pay depends on your negotiating ability and the profit margin the dealer wants to make on the instrument.

**Number of Keys/Type of Action.** Counting keys is no problem. Describing a manufacturer's proprietary hammer emulation mechanism in one or two words is another thing. To approximate the feel of an acoustic piano, several approaches are common among digital pianos. The most common is to weight each key. In addition to that, the key might be returned to its original position by springs, a weighted extension over a fulcrum point, a counterbalanced lever underneath the key, or some other technique. The action of a digital piano is something that you simply must try out before you buy; the feel differs radically from one type to another. This is much less of an issue with portable keyboards, since the action tends to be unweighted, as on synthesizers.

**Left-hand Controllers.** Some instruments have pitch-bend or modulation wheels, especially if they have a lot of non-piano sounds or if they can be used as MIDI controllers. Some have sliders that you can assign a particular task.

◀ Continued from page 69

**Polyphony/Multitimbral Parts.** The first figure indicates the maximum number of notes an instrument can produce at a time, even if you lay a two-by-four across the keys. The second tells you how many different sounds it can play at a time. This ranges from layering two sounds across the whole keyboard to having up to 16 instruments playing via MIDI or an internal sequencer.

**Number & Type of Sounds.** For the digital pianos, we've tried to spell out exactly how many sounds in the common categories an instrument has. If at least the main piano samples are in stereo, you'll see that indicated here. If an instrument has the complete General MIDI set of 128 sounds, *GM* will appear in this row.

**Keyboard Modes.** If you can have different sounds on different parts of the keyboard, *split* will appear here. If you can transpose each split independently, *trans* will be indicated. Velocity curves change how sounds respond to how hard you strike a key; *vc* denotes this ability and the number of different curves available.

**Auto-Accompaniment Styles.** This is a breakdown of the styles of music that are pre-programmed into an auto-accompaniment keyboard.

**Patterns.** Indicating maximum figures only, this is the number of variations, fills, intros, endings, and other patterns available within a single style. The second figure is the maximum number of accompanying instruments you will hear for a given style. *1-finger* indicates that the keyboard will change chord types de-

pending on the finger or combination of fingers you hold down on a specific area of the keyboard. *User-rec* indicates that you can create your own style patterns, and *user-save* tells you that the instrument will remember them. If you can change the MIDI channels of accompaniment parts, *MIDI edit* appears here.

**Disk Drive.** The Standard MIDI File format (SMF) allows sequences created on one SMF-compatible sequencer to be stored on a 3-1/2" floppy disk and subsequently read and played on another, including those with disk drives on digital pianos and portable keyboards. Some manufacturers have their own proprietary sequence formats; if a disk drive reads and writes them, these are spelled out here as well.

**Memory.** Separate from disk drives, this indicates the ability to access additional sounds or sequences from a memory card or cartridge inserted into the instrument. "Yes" indicates that whatever front-panel settings you make before you turn off the instrument will reappear when you turn the instrument on.

**Sequencer.** Many digital pianos and portable keyboards have built-in sequencers, some as simple as a single-track recorder that can hold a couple thousand notes to full-blown 16-track models. Data is listed in this order: number of tracks, maximum number of events, clock resolution in ppq, and number of songs that can be stored in internal memory. Following that, you may find that the instrument has a *quantization* feature for correcting rhythm, a *punch-in* and *punch-out* ability to re-record specific sections, the capability to save songs to a disk drive, or a *metronome* feature.

**Display.** Light-emitting diodes (LED) and liquid-crystal displays (LCD) are common. The question is one of size, which in this case will be expressed in the number of characters and lines that can be shown, or in pixels, if the display is graphic.

**Pedals.** This shows which pedals are supplied with an instrument. If there are jacks on the rear panel but pedals are not supplied, we've indicated the functions they perform.

**Amplifier & Speakers.** Most instruments have two or more speakers in a stereo configuration; the power is expressed in watts per channel.

**Audio In/Out.** The number of headphone jacks (always a stereo connection), and the number and type of audio outputs are indicated here. If an instrument accepts external signals such as a microphone or CD player, *in* and *out* connectors will be listed separately.

**Cabinet, Stand, & Bench.** This is not an issue for portable keyboards, but it takes up a lot of real estate in the digital piano chart. If an instrument comes with a *stand* or *bench*, these words will appear after the types of finish. If it's a *console* or *grand*, it won't need a stand.

**Weight & Dimensions.** Dimensions are listed width first, depth from the keyboard to the back second, and height from the floor to the top last.

**Other.** Miscellaneous or unique features that didn't fit neatly into another category are listed here, as is optional equipment. ■

## WE'RE SO CRAZY ABOUT THESE GUYS, WE'RE DOING SOMETHING THAT MAKES PERFECT SENSE.

*(We're offering the debut albums from these two new talents  
at a reduced introductory price.)*

### BRAD MEHLDAU

#### Introducing Brad Mehldau

He has toured with the Joshua Redman Quartet and recorded with Redman, Kenny Garrett, Wallace Roney and Larry Goldings on the just completed *Warner Jams, Vol. 1*. This debut release features his extraordinary piano stylings in two trio settings.

*Which brings us to...*

### LARRY GOLDINGS

#### Whatever It Takes

Playing with the likes of John Scofield and Maceo Parker, and recently appearing on *Warner Jams, Vol. 1*, is a keyboardist who takes the piano and organ to a new jazz/funk plateau. Featured special guests on his debut album include Maceo Parker, Joshua Redman, David Sanborn and Fred Wesley.

# SOUND MANAGER™ DIGITAL AUDIO

## Vision 3.0

### Empower Your Creativity

Now the world's most popular sequencing software utilizes the digital audio capabilities of Apple's Sound Manager™. Vision 3.0 lets you record, edit, and view 16 bit digital audio tracks in the same window with your MIDI sequences. On-board digital audio capability is just one of the ways Vision 3.0 empowers your creativity.

To help you create great music Vision 3.0 includes the latest releases of OMS™ and Galaxy the Universal Librarian. This highly integrated system gives you fast, flexible access to your patch library. When you're ready to mix, Vision lets you choose between a wide module console with instrument names and VU meters, or a narrow console with up to 96 fader channels—either can be configured instantly from your existing tracks.

Emmy, he has an ear  
for sound.

He listens. Half the year in the studio. The other half on the road as a live sound mixer. For Gregg Rubin the challenge is to capture the immediacy of music. After hundreds of live performances and countless hours in the studio, he knows what music really sounds like. What goes in his ear is what gets laid down on Sony Digital Audio Recording Media.

"It doesn't matter if a performance is great if the tape you're recording it on, isn't. That's why I trust Sony DAT tape for my live and 2-track masters. In the studio, I prefer Sony DASH tape. It's so precise, and I can punch as many times as I want without compromising the quality of the recording. And for live multi-track recording, I've discovered the DARS series for 8mm MDMS — it's performed flawlessly. The bottom line is that I know everything I'm putting down is safe — so the sound I hear the day of the recording is exactly the sound I hear the day of the mix."

Whether you're working in the control room, on location or in your basement, make the most of every note. Sony Digital Audio. After all, sound that inspires is not a luxury, it's a necessity. For a brochure call 1-800-955-SONY.

## PLAYING FIELD NO LONGER LEVEL

*Introducing Pianovelle™ from Baldwin*

Rise to new heights with Pianovelle™, the innovative new series of digital pianos from Baldwin. With exclusive, ground-breaking features and sounds that are startling in their realism, the Pianovelle™ RP2 digital piano is simply heads above the competition! Real piano tone is now possible thanks to exclusive Baldwin breakthroughs such as Damper Physical Model™ and Natural String Resonance™ which provide the complex sound patterns that naturally occur on acoustic pianos.

The result is a harmonically rich sound that has eluded digital pianos until today. The RP2 combines these breakthroughs with 128-note polyphony, a new exclusive 88-key weighted action and

Intelligent Music Search™, which lets you instantly recall selections from a vast built-in classical piano library by merely playing the first few notes of the song in any key or tempo!

The revolutionary new Pianovelle™ RP2 digital piano from Baldwin.

Great sounds. Exclusive new features. Down-to-earth prices.

# BUYER'S GUIDE Digital B-3 PRETENDERS BY MARK VAIL ORGANS

**F**or 40 years, roadies (and organists who couldn't afford roadies) have lugged brutally heavy Hammond organs and their companion Leslie speaker cabinets from one gig to the next, suffering back and hernia problems in the process. Today, there are numerous alternatives that, while they don't perfectly duplicate the B-3's sound nor the experience of sitting or standing at its imposing console, do an impressive and convincing (to the typical listener) job of standing in for the King of Vintage Organs. In some cases, benefits offered by the current crop of organs — programmability, MIDI, etc. — might counterbalance the thrill and effectiveness of playing the real thing. Not included in this chart (so that it wouldn't fill the entire Buyer's Guide) were organs with auto-accompaniment functions.

So what's available in the B-3 wannabe world? The following chart presents intricate data on currently available organs, both keyboard-based and modules. For more insight and actual hands-on descriptions of most of the products mentioned here, see the roundup conducted in the Sept. '95 *Keyboard*. Now, a few words of clarification about the chart.

Not every current organ offers stereo outputs. In the **1/4" output** row, we define the number of outputs, whether the output signal is stereo (just because an organ has two outs isn't a guarantee of stereo signal), and whether a headphone jack is provided. As far as we're aware, headphone outs on stereo organs are also stereo; they're mono on mono organs.

Velocity response would seem alien to most organ players, but a few instruments here provide it — for MIDI transmission and/or

some type of internal voice response, such as the percussion volume. Ditto for channel aftertouch. You'll find this information in the **voice response** line.

Likewise, **performance controls** such as drawbars — if they're present — are handled in different ways. On organs with drawbars, the internally generated timbre can be altered as notes are playing by adjusting drawbar positions. Until recently, this capability wasn't supported by some digital organs. The **foot controller** line indicates whether an organ can accommodate a footswitch and/or a pedal and what type of MIDI data, if any, is transmitted in association with their use. Whether the drawbars and other controllers transmit data via the MIDI out is another question. If data *is* transmitted, it will be one of two varieties: continuous controller or system-exclusive. The former is easier to deal with in a MIDI sequencing environment. To find out how an organ deals with its performance controls, inspect the **controls affect int/MIDI** row.

Further down the chart, you'll discover whether an organ responds to incoming **MIDI program changes** and if it lets you **remap** program changes to call up organ patches of your choice. If an organ supports **MIDI overflow**, notes that exceed the instrument's polyphonic limit will be routed to the MIDI out rather than stealing notes that are already sounding. Multitimbral organs — those that allow different organ sounds to be played over different MIDI channels — may provide **dynamic voice allocation**, which means voices are freely shared and stolen when needed among the channels, and **voice reserve**, which allows you to specify a polyphonic limit for any channel.

# ART GIVES YOU A MUCH BETTER WAY TO WARM THE SOUND OF YOUR MICS!

If you've been getting a less-than-great, cold, flat sterile sound from your mics or instruments, it's time to warm them up. Get ART's new Tube MP Microphone Preamplifier. You'll suddenly find yourself with lush, rich, and yes, WARM sounding mics. The Tube MP utilizes a hand-selected 12AX7 to impart all of the warmth, and richness you want. Plus, it's got 70dB of low-noise gain, built-in phantom power, and a phase-reverse switch. Use it for digital (or analog) recording or live shows. It's great when used as a direct box (particularly on bass) or with transducer-style or piezo pickups. Best of all, it's inexpensive enough to put one on every mic you own.

their limitations. They have them. My question is, why do we always focus on the limitations and not the possibilities?

Deity2  
via Internet

Why restrict the field of "Sounds that Must Die" [Oct. '95] to just keyboard sounds? Here are some other sounds that are overused: (1) Noisy, distorted guitars. (2) Overly processed studio drums. (3) Acoustic guitars and anything else that jangles. (4) Natural-sounding bass guitars. (5) Vocalists who whine, scream, or croon. (6) Kazoo solos (I know, not

overused, but very annoying).

ExSinnical  
via Internet

I found "20 Sounds that Must Die" largely pointless. It seemed to miss the point of *why* so many sounds these days are overused. I agree there is often little imagination or creative energy put into sounds and songs; I also agree that "[t]imbre is as fundamental as melody, harmony, or rhythm to electronic music." But where does the problem originate? I find no inspiration in the digital synthesizers that dominate the marketplace. While most of these instruments do contain enormous

computing/synthesis power, their awkward interfaces prohibit real hands-on tweaking and exploration — hence the prevalent reliance on presets, factory samples, and sample CDs. Their minuscule displays and sparse controls alienate the synthesist, preventing any real interactive relationship with the sound. The only inspiration I've found in a long time comes from vintage and newly re-emerging analog units.

Jeffrey Melton  
via Internet

"20 Sounds that Must Die" was a waste of paper. Many of your readers probably own those synths and like the patches that you dumped on. You insulted them, and for what purpose? For another thing, according to the logic of the article, just about all acoustic instruments should be thrown out the window, simply because their timbres have been used in music so often. That's ridiculous, of course, so why try to apply that logic to synthesizers?

If a sound is used often, it must be because people like it. What's wrong with that?

The article's attitude buys into the concept of planned obsolescence. Because new synths keep coming out all the time, you could fall prey to the idea that what's new is great, and therefore what's old must be no good anymore. I can understand synth manufacturers trying to promote that attitude, but not *Keyboard*.

Richard Whitehouse  
via Internet

The fact that an article like "20 Sounds that Must Die" crossed your pages is indictment enough of the current state of our musical mentality. I take offense, however, at the remarks made about the DX7. The DX7 is clearly the most important synthesizer and instrument of modern times. People who don't recognize this are not programmers, but merely people (not musicians) who bought, traded, or stole the most commonly used DX7 sounds.

Plex Barnhart  
New York, NY

There's only one thing I can think of that's more annoying than using an often-heard factory synth patch: *not* using it just because another musician might recognize it.

Mike Renneker  
Van Nuys, CA

I want to respond to your list of "Top Synth Hits" [Sept. '95]. Some of the selections (and particularly omissions) were surprising. These titles deserved serious consideration as "Top Synth Hits": Elton John's "Funeral for a Friend" (with Dave Hentschel's great Moog work), Yes's "Roundabout," Heart's "Magic Man,"

# WE LEFT OUT THE NOISE, TOO.

Although it's become something of a pro audio standard, the CR-1604 isn't the only 16-channel compact mixer around. Compare 'em knob-for-knob, button-for-button and you'll also discover that the CR-1604 is not the leader when it

**116dB INTERNAL DYNAMIC RANGE.** That's 19 times more dynamic range than the 90dB range of a compact disc! This is especially important in live sound mixing.

**WE LEFT OUT COMPLICATED INTERFACES.** You have instant, hands-on access to 3-band EQ, constant-power pan, 7 Aux sends per ch. and 4 stereo Aux returns.

**ULTRA-LOW NOISE.** When you compare noise specs, look for the test that counts: all 16 channels at Unity Gain. The Mackie CR-1604 leaves the others behind.

**WE LEFT OUT 10 MIC PREAMPS!** Instead of sixteen "acceptable" microphone preamps, the CR-1604 features six big-console-quality preamps, more headroom, greater bandwidth and less noise and distortion than the competition.

comes to sheer number of doohickies and thingamabobs.

For example, the CR-1604 has less microphone preamps than its competition. That's because we correctly assumed that most mixer users would get more benefit out of 6 low noise, studio-grade preamps than out of 16 cheaper ones. If you DO need a total of 16 ultra-wide-bandwidth, high-headroom preamps, simply add our XLR10 Mic Preamp Expander.

Quality over quantity... that's the CR-1604 design philosophy. Yet it seems to have enough of something. Because the CR-1604 has mixed and tracked more CDs, more commercials, more TV program music — and more feature film soundtracks — than any other compact mixer, period.

**3-WAY CONVERTIBLE DESIGN** DOESN'T LEAVE OUT ANY APPLICATION. The Mackie CR-1604's rotating input/output pod lets you change from a 7-rack space mixer with jacks to back to a tabletop design with jacks to top in minutes. Add our optional RotoPod bracket and rotate inputs and outputs to the same plane as the mixer's controls (a favorite for small recording set-ups).

**RFI PROTECTION** KEEPS NOISE OUT OF YOUR MIX. Our metal 1/4" jacks and washers plus internal blocking capacitors keep radio frequency interference caused by broadcast transmissions, microwaves, cell phones & computers out of your recordings.

**WE DIDN'T LEAVE ANYTHING OUT OF OUR FREE 40-PAGE BROCHURE.** Call toll-free, speak to a real person and get the most complete compact mixer information ever offered — including a 16-page applications guide.

**IF YOU OWN AN 8-TRACK DIGITAL RECORDER, YOU'RE NOT LEFT OUT.** Unlike other compact mixers, the CR-1604's split console design with post-fader channel inserts lets you simultaneously track on eight channels and monitor/mixdown on eight more.

**WE LEFT OUT OBSOLESCENCE.** Only the CR-1604 can grow with your needs. If you add a second or third digital multitrack, you can add one or two more CR-1604s with our MixerMixer active combiner.

**IMPRESSIVE MIC PREAMP SPECS.** -129.5 dBm E.I.N., 300,000Hz bandwidth, 0.005% THD. **WE CAN'T LEAVE OUT HOW GOOD OUR PREAMPS SOUND.** Top percussionists cite the CR-1604 preamps' headroom. Direct-to-DAT audiophile recordists rave about the clarity and ultra-low noise floor. Vocalists like the robust dynamic range. And several of the world's top microphone manufacturers use CR-1604 mic preamps to demo their finest condenser mics at trade shows.

# Music Software's Finest

## MicroLogic

Making music has never been so easy!  
Affordable with a professional touch.

MICROLOGIC for Windows™ and Macintosh™ introduces you to the world of computer aided composition with a package boasting a range of powerful features you won't find elsewhere in this price range. There are three professional editors to help you achieve those perfect final results in your music. The unbeaten resolution of 960 ppqn gives you the best timing available today and the integrated General MIDI mixer offers you the perfect balancing for all GM sounds

and effects. User definable color coding for all tracks and a powerful interactive notation section provide maximum overview and easy handling. Should you one day desire more functionality and power, you can simply upgrade to Logic.

## Logic

The most powerful and modern music software available for MS Windows™.

Logic for Windows is clearly the leader in integrated MIDI Recording and Notation systems on the PC platform. With an unlimited number of tracks, a large choice of quantization algorithms, our unique Environment for creating virtual MIDI studios and mixer consoles, up to 90 definable screensets, interactively linked windows, a seamlessly integrated high end scoring section, freely definable key commands for virtually every function, Logic is the

perfect tool for producing music in professional or home studio environments. Logic for Windows (also available for Macintosh) will offer you entirely new possibilities and its flexibility will amaze you again and again.

**Also available as 100 % native code version for PowerPC!**

## Audio Module

The add-on integrated module that turns Logic into a total digital studio!

Install the LOGIC AUDIO Module with LOGIC on your Mac/Power PC, and all doors to the exciting world of digital audio recording will swing wide open. You can use the Apple Sound Manager to record\* and play up to 12 tracks or use any of the audio hardware options from Digidesign (4-48 tracks\*\*). Arrange MIDI and audio tracks on one surface, edit the pitch and length of a digital audio track in one process, adapt the groove of your MIDI tracks to the groove of an audio track, turn monophonic digital

recordings into printed score and enjoy what many users say is the best music program ever made.

The LOGIC Windows AUDIO Module is scheduled for Q1/96

\* 16 bit Audio-in Mac only

\*\* 16-48 tracks using TDM EXTENSION

# Jewels. The Logic System.

## TDM EXTENSION

The LOGIC TDM EXTENSION will make your Pro Tools III a total state of the art Digital Audio Workstation!

In combination with Digidesign's Pro Tools III system and LOGIC AUDIO, the TDM EXTENSION allows for 16 - 48 digital audio tracks. Thanks to a special Audio Object in LOGIC's Environment you can create virtually any Pro Tools mixing desk that you may need. All Plug-Ins (digital effects) can be fully automated including Aux Sends and Master Outputs. Plug-Ins can also be inserted and deleted during playback and every possible TDM configuration can be saved

with your songs. Depending on your hardware, you can use as many Plug-Ins (inserts) per track and for the final mix/sum as you may need. Each of your TDM configurations can be intuitively copied from song to song. Digital audio recording luxury? This way you can...

## LOGIC AUDIO

The Modern Masterpiece. Integrated MIDI and Digital Audio Recording for those who require only the best.

LOGIC AUDIO is our flagship product in the LOGIC Series. This package integrates the complete LOGIC program with the AUDIO Module. You get up to 12 tracks using Apple's Soundmanager (AV), 4 - 48 tracks\*\* with one of Digidesign's hardware options, or 4 - 8 tracks with the Yamaha CBX D3/D5 (add CBX EXTENSION). Included at no extra charge is the legendary Digital Factory, our collection of power utilities for creative DSP editing of your audio material. The Digital Factory™ includes

the Time Machine™, the Quantize Engine™, the Silencer™, the Groove Machine™, the Audio Energizer™, the Audio to Score Streamer™, Audio to MIDI Groove Templates™ and more. You owe it to yourself to seriously check out this program before you consider buying anything else.

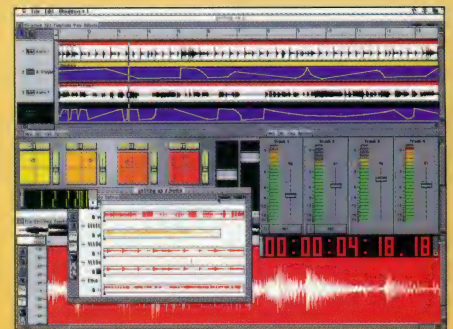

\*\* 16-48 tracks using TDM EXTENSION

## CBX EXTENSION

Affordable digital audio tracks using the powerful Yamaha CBX D3 or D5 system.

Control the innovative CBX D3 and D5 Digital Recording Processors with LOGIC AUDIO using the CBX EXTENSION. With each CBX unit you add an extra 4 digital audio tracks, 4 outputs and 2 inputs for up to 8 CBX tracks. LOGIC AUDIO is the only program that lets you use all Mac/PPC (AV), Digidesign and CBX tracks simultaneously including all options of the powerful Digital Factory.

Once eschewed by professional musicians for their cheesiness, portable keyboards have made significant strides in the past decade. High-quality sampled sounds are now standard, and rhythm accompaniment patterns are often programmed by professional musicians known for their work in the requisite styles. Some instruments have sequencing functions that rival the computer-based programs used in pro studios. They've become more than just portable keyboards: They're recording studios staffed by tireless, uncomplaining session cats with all the right instruments for the gig, just itching to go out on the road with you.

Besides the pro units loaded with bells and whistles, you'll find many reasonably-priced instruments for someone who is just starting out and has an interest in music. A couple of them even have special learning aids, such as a song library with right and left-hand parts that can be muted, or LEDs that light up over the appropriate keys to play.

Speaking of songs, portable keyboards are great tools for songwriting on the road. Hotel rooms, busses, and airport waiting rooms no longer need to be holes into which you pour unusable time. Got a great idea

for yet another song about how tough it is to be a touring musician? Whip out a demo before breakfast, play it for the band on the bus, run it down at soundcheck, and have the audience in tears that night.

Portable keyboards are about as self-contained as an electronic instrument could be. Small or large, amplifiers and speakers are built-in. For the most part, these are for the listening pleasure of the performer; audio outputs are provided on models that are designed for performing in large spaces. Many instruments can be powered by batteries as well as AC.

Nearly all of the following instruments have synthesizer-style keys, and no more than 61 of them at that. Weighted actions such as those on digital pianos tend to be, well, weighty, so you won't find them on portables. Some starter keyboards have mid-size or miniature keys, for smaller fingers, naturally. And if your fingers are already spoken for, there are two Roland instruments included here that will add auto-accompaniment to your MIDI keyboard, the RA-30 and RA-95.

**Creativity Is Priceless.  
Now, It's Also  
Affordable.**

**Introducing The QS6™  
From Alesis**

**QSE**

64 VOICE EXPANDABLE SYNTHESIZER

**H**ow much is your creativity worth? You really can't put a price on something so valuable. The powerful new **QS6™ 64 Voice Expandable Synthesizer** gives you everything you need to push your creativity to new levels. It's the affordable solution for musical inspiration.

## Studio Quality Sound

The QS6 has all the great sounds that inspire you to do your best work. You'll find everything from realistic acoustic instruments to cutting-edge and vintage synth sounds, all accessible at the touch of a button. Its digital 16-bit linear non-compressed samples provide warm, clean, and incredibly accurate voicing for every performance. The onboard multieffects use the same advanced processor as our Q2™ Master Effects, and include reverb, chorus, flange, delay, rotating speaker effects and more. Combine these effects with the QS6's massive sound library, and you'll create CD-quality mixes right from your synth.

The rhythmic/sonic loops let your creativity groove just by holding down a single key. QS6's great feeling, semi-weighted keyboard offers velocity, release velocity and aftertouch for expressive playability. Furthermore, all of this power is packed into a tough all-metal chassis that will take the punishment when you take your show on the road.

## Choice, Variety and Expandability

The QS6 offers a huge palette of internal sounds - 8 megabytes of sample waveforms, 640 Programs, and 500 Mixes - giving you thousands of timbral options to choose from. This sonic library can be expanded instantly by simply plugging in a 4MB or 8MB Alesis QuadraCard™, like our acclaimed Stereo Grand Piano card. Also, the QS6 includes Alesis' exclusive Sound Bridge™ software (for Mac and PC) which allows you create custom cards with your own sound files from your computer. This innovative technology guarantees that you'll always have access to new sounds.

## Powerful Synthesis Engine

The QS6 uses the same advanced synthesis architecture as its big brother, the QuadraSynth Plus™. True 64-voice polyphony lets you assemble complex sequences and rich, stacked chords. Its 16 channel multitimbral Mixes and a built-in computer interface (also for both Mac and PC) give you easy access to the world of MIDI sequencing, software and composition. In fact, we've included a free CD-ROM with

the QS6 that's packed with extra sounds, killer sequences, and Steinberg's Cubase Lite™ sequencing software to help get your creative juices flowing.

The QS6 is an instrument that was crafted to help you unlock your creative talents. Stop by an Alesis Dealer and start creating new music with the newest keyboard from Alesis.

For more information about the QS6, see your Authorized Alesis Dealer or call 310-841-2272. QS6, QuadraSynth, QuadraCard and Sound Bridge are trademarks of Alesis Corporation.

# THE POWERSTATION.™

"19" rack mount sides available"

## THE INTEGRATION OF SOUNDCRAFT QUALITY AND LEXICON DIGITAL EFFECTS

With our new Powerstation we've designed much more than just another powered mixer. Not only have we eliminated the need for a separate power amp, but we've built in one of the highest quality digital reverb units available today. The Powerstation provides everything you need between stage and speakers in a single package.

**LEXICON PROCESSOR** - The most respected name in digital effects, gives you a carefully selected range of unique effects that will enhance your creative control.

**POWER AMP** - Most powered mixers in this range have earned a reputation of underpowered performance especially with the many power hungry professional speakers available today. But the Powerstation delivers 300 watts (into 4 ohms) per side which drive even a power hungry system to very LOUD levels. And we do it with the lowest distortion figures in the industry (THD = 0.025% @ 4 ohms/both channels.)

**TRUE BRITISH SOUND** - The one thing no other mixer in the world can offer is Soundcraft's British EQ. That clean, crisp mix that defines

British Sound. Our 3 band EQ and sweepable mids provide the sound quality that made Soundcraft famous. We've also packed the Powerstation with:

- **BULLET-PROOF MIC PRE-AMPS** - Our exclusive Ultra-Mic™ pre-amps give you more signal handling capacity to connect signals ranging from low output dynamic mics to active DI boxes without the fear of clipping.
- **7 BAND GRAPHIC EQ** - A true creative tool that allows you to handle the acoustics of any room.
- **HIGH PASS "RUMBLE" FILTER ON EVERY MONO INPUT** - Now you can eliminate low frequency rumble before it has a chance to fog up the mix. We've even included a sub sonic filter just before the power amp input to eliminate "DC-Shift" in the main speakers - a major cause of speaker damage when working at high levels.

One of the most amazing things about the Powerstation is that we've managed to package all of this performance for less than \$1600. See your nearest Spirit dealer today for a demo and you'll understand why British Sound is *back in the U.S. . . . back in the U.S. . . .*

## BUYER'S GUIDE

### PERCUSSION

#### KITS, CONTROLLERS, MODULES, & MACHINES

BY GREG RULE

**S**ongs with weak drum tracks are like houses built on sand. If your foundations aren't solid, everything you stack on top is in serious danger of collapse. Don't take your drum and percussion sequences lightly, campers. There are plenty of quality products on the market to help you lay down great-sounding, stone-solid beats — be it with sticks on pads or fingers on buttons.

With that in mind, we've compiled a representative (though not all-encompassing) list of the current "plugged" percussion crop, all of which were in production at the time of this writing. Items such as rhythm-type computer software, individual drum pads, triggers, and their associated hardware weren't included; we chose to limit this group to self-contained systems and major electronic percussion components along the lines of drum machines and modules. As always, we encourage you to visit a local retailer or contact the various manufacturers for a more detailed look at their available instruments and accessories. The addresses and phone numbers can be found beginning on page 162. One final note: A few items in the list, such as the Akai MPC3000 and ddrum3, appear in other sections of this magazine (the sampler chart, for example), so if you lust for more info on a particular hybrid-type product, you might look for it elsewhere in this issue. Happy hammering!

**Kat dk10.** Self-contained MIDI percussion controller. A scaled-down version of the drumKat with ten FSR pads, one trigger input, four user kits, six factory kits, pad response training mode. \$499.

**Kat malletKat Pro.** Self-contained marimba-style MIDI percussion controller. Modular design allows extra octaves to be added, 127 user setups. \$1,999.

**Kat malletKat Pro WS** (with sounds). Same features as malletKat Pro but with 300 internal sounds by Kurzweil. \$2,899.

**Kat trapKat.** Self-contained MIDI percussion controller. 24 gum rubber pad surfaces (both raised and flat surfaces), 24 programmable kits, 24 factory kits, 34 GM-mapped sequences, four footswitch inputs, two external pad inputs, breath control input. Reviewed June '95. \$1,199.

**Korg Wavedrum.** Self-contained electronic drum with DSP synth engine. Playable by sticks or hands, 62 algorithms, 100 programmable patches, optional RE1 remote programmer, sys-ex storage, uses a tunable 10" drumhead, tripod stand included. Reviewed March '95. \$2,500.

**Roland SPD-11 Total Percussion Pad.** MIDI percussion controller with sounds. Eight velocity-sensitive pads, 255 16-bit PCM sampled sounds, 64 patches, four patch chains, built-in digital effects processor (reverb, delay, chorus, and flange), four dual trigger inputs. \$895.

**Roland TD-5K Compact Drum System.** Electronic drum kit. Includes TD-5 drum module (see below), five PD-5 pads, FD-7 hi-hat controller, KD-5 kick trigger (reverse beater included), MDS-7 Total Drum System Stand (includes all mounting hardware and cables). \$1,795.

**Roland TDE-5K Compact Drum System: Expanded Kit.** Electronic drum kit. Includes TD-7 drum module (see below), seven PD-5 pads, FD-7 hi-hat controller, KD-5 kick trigger (reverse beater included), MDS-7 Total Drum System Stand (includes all mounting hardware and cables). \$2,045.

**Roland TDB-7K Total Drum System: Basic.** Electronic drum kit. Includes TD-7 drum module (see below), four PD-5 pads, FD-7 hi-hat controller, KD-5 kick trigger (reverse beater included), MDS-7 Total Drum System Stand (includes all mounting hardware and cables). \$2,050.

**Roland TDE-7K Compact Drum System: Expanded.** Electronic drum kit. Includes TD-7 drum module (see below), eight PD-5 pads, FD-7 hi-hat controller, KD-5 kick trigger (reverse beater included), MDS-7 Total Drum System Stand (includes all mounting hardware and cables). Reviewed Oct. '94. \$3,145.

**Simmons Turtletrap.** Self-contained MIDI percussion controller. Ten soft rubber pads, eight trigger inputs, 30 programmable kits. \$799.

**Walkabout Percussion Controller.** Strap-on pad set/retrofit for Roland SPD-11. \$1,595 and up.

**Yamaha TMS4.** Electronic drum kit. Includes TMX drum module (see below), four EP75 dual zone pads, KP75 kick pad, two WS840 double pad stands. \$1,580.

**Yamaha TMS5.** Electronic drum kit. Includes TMX drum module (see below), five EP75 dual zone pads, KP75 kick pad, FC5X footswitch, three WS840 double pad stands. \$1,875.

**Yamaha TMS8.** Electronic drum kit. Includes TMX drum module (see below), eight EP75 dual zone pads, KP75 kick pad, FC5X footswitch, four WS840 double pad stands. \$2,460.

**Zendrum.** MIDI strap-on percussion controller. 24 touch-sensitive finger triggers, 127 programmable kits, four-way velocity cross-fades, sys-ex storage, two footswitch ins. Reviewed Nov. '95. \$1,350 and up.

## PERCUSSION SOUND MODULES

**Alesis D4.** Single-space rack module with 500 samples, 3Mb waveform ROM, front-panel trigger button, 16-voice polyphony, 12 trigger inputs with adjustable gain. Reviewed Feb. '92. \$399.

**Alesis DM5.** Single-space rack module with 500 samples (including the "best of" from Alesis HR-series machines), 18-bit DACs, 12 trigger inputs, sample randomization utility, MIDI overflow. \$449.

**E-mu ProCussion.** 16-bit sounds (4Mb sample ROM) configurable into 1,000-plus locations, 128 kits (64 preset, 64 user), 32-voice polyphony, extensive stacking and editing, cross-switching and -fading, six audio outputs, two effects sends/returns. Reviewed June '91. \$995.

**Roland TD-5.** 210 drum and percussion samples, 32 kits, built-in digital effects processor with reverb and chorus, 14-voice polyphony, metronome feature, eight dual trigger inputs. \$595.

**Roland TD-7.** 512 sounds made up of 256 16-bit waveforms, 32 kits, 14-voice polyphony, velocity cross-switching and -fading, layering, built-in effects, sequencer (96 ppq, 24 preset patterns, 24 user patterns), metronome, and nine dual trigger inputs. Reviewed Oct. '94. \$795.

**Yamaha TMX.** 245 drum and percussion samples, AWM2 sample playback tone generator, 32 programmable kits, 12 trigger inputs, four audio outputs, single-space rack module with headphone output and accompanying volume control. \$495.

## DRUM MACHINES

**Akai MPC3000.** 16-bit sampler/MIDI sequencer/drum machine, up to 16Mb RAM, 32-voice polyphony, 16 velocity-sensitive buttons, 99-track sequencer, 96 ppq, SMPTE read/write, four MIDI outputs, ten audio outputs. \$3,699.

**Alesis SR16.** 233 16-bit sounds, 1Mb waveform ROM, 96 ppq, 100 songs, 100 user patterns, 100 preset patterns, 100 user fills, 100 preset fills, 50 user kits, 50 preset kits, four audio outputs. Reviewed May '91. \$349.

**Boss DR-5 Dr. Rhythm Section.** 256 16-bit sampled sounds, 48 ppq, 64 kits (48 preset, 16 user), 400 patterns, 20 songs, 4-track sequencing, guitar input with built-in tuner, amp simulator, external pitch function for triggering sounds from a guitar. \$595.

**Boss DR-550mkII Dr. Rhythm.** 91 16-bit sampled sounds, 16 ppq, 12-voice polyphony, 64 user patterns, 64 preset patterns, eight songs, battery or AC powered. Original DR-550 reviewed July '90. \$350.

**Boss DR-660 Dr. Rhythm.** 255 16-bit editable sounds, 96 ppq, built-in digital effects processor (reverb, delay, chorus, and flange), 39 drum kits, 250 patterns, 100 songs, stereo outputs plus two individual outs. \$595.

**Oberheim Drummer.** Interactive drum pattern sequencer. Analyzes and alters incoming MIDI data *en route* to a drum machine or drum module. Reviewed July '91. \$249.

**Roland R-70 Human Rhythm Composer.** 16-bit sounds, 96 ppq, 16 velocity- and aftertouch-sensitive pads, positional pad for realtime nuance control, 210 preset instruments plus 32 "copy" instruments, 100 patterns, 20 songs, built-in effects processor (reverb, delay, chorus, and flange), stereo outputs plus two individual outs. Reviewed July '92. \$950.

**Roland R-8mkII Human Rhythm Composer.** 16-bit sounds, 96 ppq, 200 internal instruments, 26 additional instruments on SN-R8 sound cards, velocity- and aftertouch-sensitive pads, 32 preset patterns, 200 programmable patterns, up to ten songs, nuance control provides timbral variations of sounds, eight individual outputs plus two stereo outs. Original R-8 reviewed April '89. \$1,245.

**Yamaha RY8.** 256 AWM sampled sounds, 24 ppq, 28-note polyphony, 200 preset patterns, 50 user patterns, 200 backing patterns, assignable chord track, AC or battery powered. \$299.95.

**Yamaha RY20.** 300 AWM2 sampled sounds, 96 ppq, 50 songs, 20 preset kits, 20 user kits, DSP with six reverbs and four delays with tempo sync, 12 velocity-sensitive pads with four curves, groove quantize, track-based patterns. \$499.95. ■

# Hands Job.

Got a bunch of restless hands? Who doesn't? But we put ours to good use and created the e-64 — a stunning 64-voice digital sampling system. Sporting enough polyphony to keep 13 of your favorite hands working up a sweat. That's right, 64 fingers worth of massaging the ivories!

But the e-64 is not just another digital sampler. Once you've gotten over the hard fact that E-mu has *done it again* with the industry's only 13-hand sampler, catch your breath and check out its features. Like up to 64 MB of sample memory, 64 6-pole digital resonant filters and compatibility with E-mu and Akai S1000/1100 16-bit sound libraries. Then get a grip on a few more — including an enormous new icon-based user interface, on-board graphic waveform editing, resampling and load while you play, virtually distortionless pitch transposition over 10 octaves, and AES/EBU digital I/O.

The e-64 will really make you squirm when you groove on its righteous audio resolution. That's what it's all about anyway, right? Right. The e-64 features the same pristine audio quality that you expect from the company that pioneered sampling technology in the first place. (Duh... we're talkin' Emulator here, guys.)

The bottom line? If you're shopping for a sampler, there's no comparison to E-mu's rock hard e-64. If you're not looking for a sampler, you should be. The e-64 has turned the page on what a sampler can do for your creativity and your music. Serious self stimulation.

But don't break this rhythm. The e-64 is exploding at your favorite E-mu dealer right now. So get your hands out of your pockets and do the right thing... Check it out for yourself. It's a real handful.

The **SX** is a full-blown music workstation style keyboard, using the same "engine" as the award-winning S Series Turbo MusicProcessor, with all the things the MusicProcessor is famous for: hundreds of huge, fat sounds with 32-voice polyphony, a powerful 250,000 event 16-track sequencer (no that is not a typo, 250,000 events), dual digital effects processors, and a 3.5" disk drive. But that is only the beginning.

Although the **SX** has much in common with other workstations, it is capable of producing musical ideas of its own — riffs and patterns called **Styles** that can be edited, looped and combined to create and inspire your songs within minutes. The **SX** even has 64 programmable **Styles** for you to create your own patterns.

Basically, this whole ad is trying to tell you that Generalmusic's **SX** keyboard is much better than the Korg i3. In case you still don't get it, here are the precise reasons why.

## Generalmusic's New SX Multimedia Workstation

**Sure, that would be enough - but wait, there's more!** *Imagine*, without using any complicated computer software, pressing a single button and seeing any sequencer track instantly displayed as a musical score. Plus, the unique **SX** "preload" feature allows you to load new sounds and sequences while playing. The **SX** can be expanded with 2MB of optional sample RAM, which allows you to load in your favorite digital samples from choirs, to guitars, to applause. And, the optional video interface provides the connection to most televisions or computer monitors, which allows you to share your lyrics, music, or both with other people, turning your every performance into a multimedia event. For even more versatility the **SX** is available in two keyboard versions.

The **SX2** is 61-note keyboard, while the **SX3** has the expanded 76-note keyboard, both with lightly-weighted actions.

The new **SX** from Generalmusic is possibly more keyboard than you ever imagined. Way better, way cool, lots of fun, and for a lot less money than you might think. Visit your Generalmusic dealer today or contact Generalmusic Corporation for more information and the dealer closest to you.

The *Lexicon* tradition of sound quality is so highly respected that over 80% of recordings made in the world today utilize a Lexicon reverberation or effects processor. And while a Lexicon is an integral component in practically every World Class audio production environment, there's also a Lexicon processor for the equally demanding needs of project studios — as well as performing musicians. Every one offers the superlative Lexicon sound: from the

# Digital MULTITRACKS

## STAND-ALONE DIGITAL TAPE & HARD DISK RECORDERS

BY RANDY ALBERTS

**D**uring the '80s, the concept of an affordable digital multitrack recorder — as in one that cost less than six figures — seemed farfetched. But you know how technology works. Earlier this decade, the ante was lowered to a few thousand dollars for a digital multitrack of either the tape or hard disk persuasion. We'll refer you elsewhere — the July '92 *Keyboard* cover story is the best reference we can think of — for a discussion on the merits of the two formats.

Consistent with the rest of this year's Buyer's Guide, we haven't included computer-dependent hard disk recording systems (see the December '94 *Keyboard* for a buyer's guide to those). All of the digital recorders in the following chart are stand-alone.

What about analog multitracks? Good question. For cassette multitracks, which qualify as absolute bargains compared to their digital counterparts, you only need last month's *Keyboard*, in which we printed a comprehensive chart and reviewed over a dozen models. Reel-to-reel is another story. As much as we'd love to track down and report on the current state of reel recorders, we simply didn't have the resources or space to do it. Besides, if it's 24 tracks you're craving, consider that the recorders in the following chart are modular; you can start with four or eight tracks and later add on more machines, all of them perfectly synced. (Note that one of the recorders listed here, the Otari RADAR, can be expanded up to 24 tracks all by itself.)

One caveat about upgrading to a digital recorder: You may need to replace other components in your studio to reap the sonic rewards a digital recorder offers. Specifically, your mixer's specs need to be optimal, as do any outboard processors that you route signals through. A digital recorder will only sound as good as the signal you pump into it. Remember: garbage in, garbage out.

The only chart item that requires clarification is the one labeled "EDL." It stands for Edit Decision List, a feature that requires a computer, so we'll say no more. —Mark Vail

PERFORMANCE SEQUENCES™

### MIDI MUSIC WITH THE HUMAN TOUCH!

The most widely used midi sequences in the world. First in customer satisfaction for over six years. Over 1,500 song titles available for any musical application. All programmed in LA for consistent top quality by Stephen Kern.

From Pop to Rock. From Country to Standards to custom programming, we've got it all!

Trycho sequences are available for most popular computer and hardware based sequencer systems. We even have stereo audio cassette and DAT versions for non-sequencer users. We're the only sequencing company authorized as a dealer for equipment we support. For you, this means great sequences, fast setup, access to the best midi hardware, comprehensive technical support, and fantastic overall service six days a week - year in and year out.

So whether you're involved with audio production, multimedia presentations, are a hobbyist or a professional musician in a solo, duo or trio act, you can count on **TRYCHO TUNES** for the absolute best in midi sequences.

How in the  
world  
did people  
work  
before Pro Tools™?

-----[painfully]-----

Sure, you could record, edit, process, mix and master your next platinum record without 16 to 48 tracks of record and play. You may not need 64 channels of input and output. Or every sound-perfecting extra from our 100 Development Partners.

But the reason more top music professionals use a Pro Tools III system

than all other digital audio workstations combined, is that it

opens up more creative possibilities.

Pro Tools III provides more options

to manipulate vocals, drums and

other instrumentation, in a random-

access, non-destructive format. And,

thanks to our TDM digital mixing

and DSP Plug-In environment, you

have complete control, all on one desktop, all in one high-quality digital format.

You can even burn a CD the moment you've completed your masterpiece.

"Pro Tools is my Swiss army knife for recording."  
Jerry Harrison

In short, Pro Tools III is all about

making music better, not just faster.

Which is exactly how you've wanted to work, all along.

# \$8,000 IS A GREAT PRICE FOR THIS MUCH WORKSTATION. SO WHY ARE WE CHARGING ONLY \$449?

If you've checked out any of the professionally featured digital audio workstations on the market, no doubt you've seen just how much they can do. And perhaps you've also seen—once you tally up the required tangle of audio cards, DSP cards, and interfaces—that \$8,000 is what a DSP-equipped professional workstation costs. Until now.

Finally, there's an intelligent alternative. Two of the audio industry's most innovative software developers have teamed up to create a powerful digital audio workstation, complete with advanced multi-effects digital signal processing *built-in*. And even better, if you own a Power Mac®, you already own all the hardware you need.

So where's the rest of the workstation? It's waiting for

you, in two remarkably powerful and affordable software programs: OSC's DECK™ II, and InVision Interactive's CyberSound™ FX.

Together they take advantage of all the *power* in your Mac—and transform it into a fully equipped digital audio workstation. You can do it all: Record. Edit. Mix. Signal process. Sync music, dialog and effects to QuickTime™ video. Play back MIDI or sync to a sequencer. And lots more.

Go on, call us today for your free demo disks, and ask about our special time-limited bundle pricing. You'll find that DECK II and CyberSound FX have everything you'd expect to find on a high-end workstation.

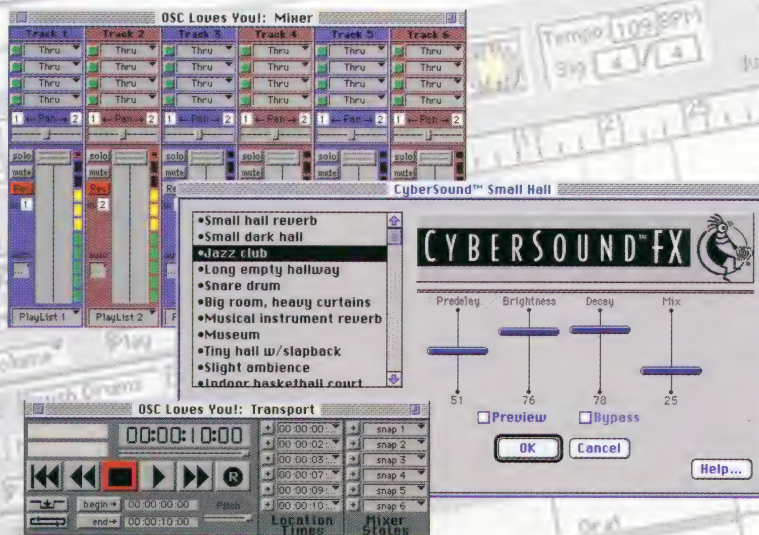

Which brings us to why we're charging only \$449. There was one big feature that we had to omit.

The expense.

## DECK II 2.5: Full-Featured Multitrack Digital Audio Recording & Editing

# BUYER'S GUIDE

# Effects Processors

## CH...CH...CH...CH...CHANGES IN THE EE...EE...EFFECTS WORLD

BY MARK VAIL

**W**hile the number of drum machines and hardware sequencers has dwindled since we put together our huge December '90 Buyer's Guide, the programmable effects category has expanded — from a total of 24 to 42 machines. So have their capabilities. Thus our '96 Buyer's Guide effects chart, which begins on page 118, has expanded beyond the '90 and subsequent Dec. '92 versions, both vertically and laterally, to incorporate all the products as well as what they can do.

Besides the programmable effects chart, there's a list of preset and specialized processors beginning on page 130. There's been considerable growth here as well, from a paltry four products in 1990 to more than 20. The manufacturers of these preset and specialized processors kindly submitted almost as much technical information as we present for the programmable devices. Unfortunately, space allows us to supply only general information on them — specifically, the manufacturer and product names, a brief description of what each one does, and their retail prices.

Once you've taken a gander at the effects chart, you'll probably wonder what the heck it all means. So let's clarify some of the categories and entries.

**Sample bit resolution** is specified for three parts of the signal chain: the analog-to-digital conversion, the internal microprocessor, and the digital-to-analog conversion. Other factors being equal, the higher the resolution, the higher the dynamic range. Of course, there are other factors that determine a processor's sound quality. In some cases, a well designed 16-bit machine might sonically outperform a poorly designed 20-bit model. Use your ears; they're the best guide to what you should buy.

Next is the **sample rate**, which is indicated in kiloHertz (kHz). The higher the sampling rate, the higher the frequencies that can be processed and passed through the device. According to the Nyquist theorem, in order for a sampled sound to be accurately represented during playback, the sampling frequency must be at least twice that of the highest overtone in the sound. At the CD-standard sampling rate of 44.1kHz, frequencies of up to 22kHz can theoretically be reproduced.

Closely related to sample rate is **bandwidth** — the range of the frequency spectrum that the device can reproduce without a lot of dips and peaks in its frequency response curve.

Filling out the spec section of the chart is **dynamic range**, which indicates the signal-to-noise ratio for each unit. The bandwidth and dynamic range figures, provided by each manufacturer, refer to the *wet*, processed

frequency response, not the dry signal. A standard full-bandwidth frequency response is 20Hz-20kHz.

Most processors provide stereo **audio ins** and **outs**, although some "stereo" effects boxes actually only pass the *dry* signal through in stereo. The left and right input signals are summed, processed, and then divided to be mixed with the dry left and right output signals. Our chart indicates whether a device has balanced or unbalanced jacks, the former as either 1/4" TRS (tip-ring-sleeve) or XLR jacks.

Units that provide **input** and **output level switches** are more flexible than those that don't, because they can more easily work in either -10dB "semi-pro" (including home studio) or +4dB pro environments. Where possible, we indicate whether the level switch is provided for the inputs, outputs, or both.

On any digital audio product, it's essential that correct input levels be maintained. If the input signal drops too low, you won't obtain the full dynamic range and sample resolution that a processor offers. On the other hand, if the signal gets too hot, you increase the chances of experiencing nasty digital clipping. To help you set the right levels, a processor should provide **input meters**. The more LED segments, the better.

Most processors offer **knobs** so that you can adjust input and output levels. Some units also provide a knob for controlling the dry/effect mix. In most cases, these knobs affect all programs (effect "patches") globally, although many processors offer programmable levels — a function that will be covered in more detail below. Knobs also appear for program selection, data entry, and various other operations as noted in the chart.

There are three entries for each unit in the **ROM/RAM programs** row: **factory**, those programs crafted by product specialists to show off the machine's capabilities (resident in the device when you buy it new); **user**, those in RAM, or random-access memory, that you can replace with your own custom programs; and **expandability**, which a handful of processors now have. Note that, for those memory-expandable machines, our specs refer only to the unexpanded unit.

Factory programs in many processors are stored in ROM (read-only memory), which means you can't overwrite them. In some cases, the factory programs are stored in RAM, and you can alter or overwrite these with your own effects. The question is, on the latter machines, can you

restore the factory RAM programs? If the answer is yes, can you restore single programs, or only all of them at once? Where possible, we answer these questions for you.

**Front panel program access** refers to how you move from one memory location to another on the unit itself. One processor might offer increment/decrement buttons, while another permits fast scroll, or even random access using a numeric keypad.

Some effects devices can perform multiple digital signal processing (DSP) tasks at once. These are identified by a number in the **simultaneous effects** row, which indicates how many effects can be active at once. The number of **effects algorithms** and **routing configurations** is also specified for multi-effect programs, as is information on whether you can alter the order of active effects in the effects chain or the arrangement is fixed.

In the **reverbs** row, you'll find out what kind of virtual environments, if any, are provided, such as hall, plate, chamber, and room. We also let you know in the chart which units offer gated, reverse, and other types of synthetic reverb effects.

One of the key reverb parameters is the **maximum predelay**. Predelay lets you forestall the onset of the reverb effect for a predetermined amount of time. This allows the attack of your source signal to be heard before it gets bathed in reverberated sound waves. Predelay also helps

define the apparent size of a simulated space. The reverb **decay** parameter determines the length of time that will elapse before reverberations fade away to nothing.

Other reverb parameters are revealed in **editable reverb parameters**. When we ran out of room to list all the effects offered by a particular device, we stooped to using "etc."

The kind of delay and echo effects available are detailed in **representative DDL FX**. For example, **multi-tap** indicates that a processor lets you set separate delay times for the left and right channels. **Maximum DDL time** tells you how long an echo you can create (without feedback).

Signal processing functions such as chorusing, flanging, phasing, and pitch-shifting are known as modulation effects, so naturally we list these under **representative modulation effects**. The modulation sources for these effects are **LFO waveforms**, and the type of modulating waveform used can drastically alter the resulting effect. Although *sine* and *triangle* waves are most common, some machines offer a wider variety of possible waveforms.

**EQ** is provided as a distinct effect on some processors; it's part of particular effects algorithms on others. EQ ranges from simple low-pass filtering to full-blown parametric and graphic equalization. Our grab-bag category for miscellaneous tools like compressors, panners, exciters, expanders, noise gates, distortion, and so on is **other effects**.

We define pitch transposition as the ability

to move a note more than a whole-step up or down from its original frequency. Our chart shows transposition **range** and the number of **harmony** parts a unit can generate. Some manufacturers provided us with **detune range** figures instead of the **resolution** number we were seeking. If the value in this field is  $\pm 50$  or 100 cents, it describes the range; a 1 cent entry means that's the resolution.

If a device features a **programmable output level**, it usually means the master level is stored for each effect patch. Wet-to-dry mix may also be programmable, as noted in the **programmable effects/dry mix** row.

What kind of **MIDI ports** — if any — does each processor offer on its rear panel? On some models, a single jack might be switchable, using a hardware or software switch, between out and thru operation. All units with MIDI jacks in this roundup are capable of responding to **MIDI program changes**. For optimum memory management, some units offer **program change remapping**, which means you can access your favorite multi-effect patch using many different program change numbers without copying the patch to multiple memory locations.

If a machine is capable of performing a **MIDI bulk dump**, you should be able to save your effects patches via system-exclusive to a computer or data storage device. Better effects devices let you dump and retrieve individual patches as well as the entire memory contents.

# PowerTracks Pro™

SEQUENCER/NOTATION/PRINTING FOR WINDOWS (IBM)

...at the incredible price of \$29

**"Solid sequencing at an unbelievable price" Electronic Musician**

**NEW! Version 3.0**

PowerTracks is a professional, fully featured MIDI sequencing/notation/printing program, and is so easy to use. With version 3.0, we've added Wave file (audio) recording & playback, allowing you to add an audio track to your MIDI sequence! And we include versions for Windows 3.1/95 AND DOS, so you'll be able to use PowerTracks on all of your machines!

**NEW PowerTracks Pro 3.0 for Windows**

For starters... PowerTracks has all the Pro features found in sequencers costing hundreds of \$\$ more.

**PRO RECORDING, PLAYBACK, SYNCH, EDIT & SYS-EX OPTIONS:** 48 tracks, real/step/punch record, sound-on-sound, MIDI File support, sync (SMPTe, Midi Time Code, MIDI) edit (quantize/cut/copy/paste/undo/data filters/transpose), multi-port support, 480 ppq timebase, sys-ex-editor-librarian, patch names, banks & much more.

**MUSIC NOTATION & PRINTOUT (on any printer):** Enter/edit/display music in standard music notation. Intelligent/automatic features such as: correct beaming/tying of notes/minimize rests option/ "Jazz eighth notes" option (this automatically allows jazz swing eighth notes & triplets to be notated properly!!). Reads in any MIDI file & displays it as notation!! Print any track in standard music notation. Selectable staves per page and bars per line. Selectable margins and paper size. Portrait or landscape (sideways) printing. Titles, composer, style, copyright information. Make your own lead sheets! You can also print the piano roll window for even more detailed analysis of a track!

**WAVE FILE SUPPORT:** Record and Play WAVE (audio) files inside the program (to 48KHz). Record an audio track of your singing or guitar playing along to a MIDI Sequence — all stored on disk!

**PROGRAMMABLE:** Programmers can extend the features of PowerTracks using the language of their choice (C, Basic, Delphi) using .DLL files. Customize PowerTracks to your needs, or purchase third-party add-ons for your synthesizer/sound card.

**NEWEST FEATURES:** We've added 30 new features in Version 3.0 — Wave file record and playback, lyrics, drum pattern editor Piano, Auto-Hand Splitting • Programmable using DLLs • Patch/Bank names • non-GM Drum mapping • Win95 friendly • over 30 new features in all (existing customers may upgrade for \$15)

**DELUXE WINDOWS INTERFACE:** Multiple Windows — Staff Roll, Event List, Tracks, Bars, Meter, Tempo, Piano keyboard, Guitar fretboard.

**BUT POWERTRACKS GOES MUCH FURTHER... WITH EXCITING FEATURES NOT FOUND IN OTHER SEQUENCERS!**

✓ Enter/print out Chord symbols in Notation ✓ Automatic Drum tracks (100 drum styles included) ✓ Reads in Chord Symbols from Band-in-a-Box 6.0 MIDI files ✓ Patch caching for Gravis Ultrasound ✓ Comprehensive support for Guitar (on-screen guitar, tab printout) ✓ Built-in Roland Sound Canvas Editor ✓ On-screen piano and guitar show notes as they're played ✓ Pro MIDI files included

**Our customers love PowerTracks!! Here are some actual comments from customers...**

"Killer software" "Unbelievable" "Intuitive and powerful" "Best MIDI program on the market" "I love the notation" "Incredible features & easy to use" "Other packages just don't compare" "Totally unbelievable — I love it!"

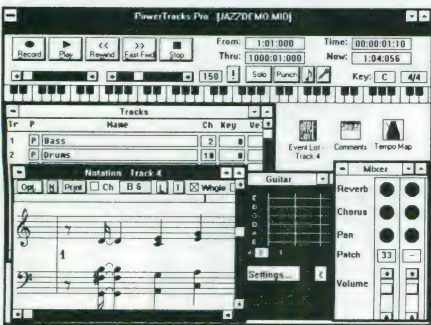

**REQUIREMENTS:** PowerTracks for Windows — Windows 3.1/Windows 95, IBM Compatible AT, 386 or higher, 2mb RAM, Supports any device compatible with Windows 3.1 including Roland MPU401, Music Quest MQX interfaces, Key Electronics MIDIATOR, SoundBlaster, AdLib, TurtleBeach, etc.  
PowerTracks for DOS — DOS 3.3 or higher, 640K, XT/286/386 or better, MIDI interface (Roland MPU401, Music Quest MQX series, SoundBlaster MIDI and FM sounds, Midiator, Roland SC7, Yamaha TG100) or AdLib/SoundBlaster compatible sound card.

to continuous controller messages, also known as **MIDI real-time** control? If so, how many simultaneous controllers will it respond to? Check out this row of the chart for the answer.

Here are a couple of handy items too often missing on programmable devices: **edit/compare** and **bypass** buttons. While the former allows you to switch between a patch that you're editing and one stored in the machine to evaluate your work, the latter lets you toggle between the processed and dry sounds. This function might also be accessible via an input for a **footswitch**, which may also be used to control the DDL's echo rate (tap tempo) or the speed of a Leslie simulator.

# IF YOU CAN FIND ANOTHER SYNTH THAT SOUNDS THIS GOOD,\*IS THIS EASY TO USE, FEATURES 6 EFFECTS PROCESSORS AND STARTS AT UNDER \$2,000,\*\* BUY IT.

We'll save you some time. There is not another synth that sounds as good or is as **EASY TO USE** as the Yamaha W5/W7. Period. And there isn't a synth anywhere near \$2,000 that gives you 6 DSPs for up to 10 simultaneous effects. (That's the whole story.

You don't even need to read the rest of this ad. Go out now and get a W5 or W7.)

Still reading? Then you'll want to know why it's so **EASY TO USE**. For one, it features a unique "virtual mixer" interface that's like working in a fully-equipped professional studio. Use the mixer to balance and pan all 16 sequencer tracks and put your own spin on the 384 exceptional AWM2 voices.

For instance, in the mixer you'll apply the W5/W7's digital effects to both individual voices and the overall mix. For the first time, you're able to

keep your wet voice effects and overall mix effects and stay true to your musical vision. **NO COMPROMISES.**

(These are many of the same effects you'll find on the Yamaha SPX990, a dedicated, top-of-the-line digital effects processor.)

A second feature that makes the W5/W7 so easy is the programming templates. Why run around doing

"leg work" when the W5/W7 already provides you with 171 ready-made combinations of amplitude envelopes, filters, pitch envelopes and LFOs.

A third W5/W7 easy service is the **FREE** voice editing software for Macintosh® computers. Dig down deep and change just about anything you want with ease. There's no end to the control you can take.

You can also add more superb voices using the W5/W7's expansion port. Optional *Grand Piano*,

*Vintage Sounds*, and *Rhythm Section* cards each add 4MB of WaveROM to the 8MB on the W5/W7.

One last thought before you get in the car. The W5/W7 interface is exceptionally shallow. Virtually every feature, voice and effect can be applied with no more than two key strokes. So **MAKING MUSIC** takes precedence over using a synthesizer.

Naturally, there's lots more to the W5/W7. So ask your local Yamaha dealer. Or download information now from America Online (Keyword SSS→Industry News→Yamaha→Color Brochures Folder→Synthesizers).

You can look a long, long time for another synth with all the features, the **EASE OF USE**, the sound quality and the price of the Yamaha W5/W7 synthesizer. (And you won't find it.) Or you can just go to your Yamaha dealer and start making music today.

A DOZEN NEW  
WE JUST MADE**WHAT IS VLZ?**

VLZ stands for Very Low Impedance. Originally developed for our 8•Bus consoles, it's a unique Mackie approach to circuit design that reduces thermal noise and seriously cuts down on crosstalk. The end result is that VLZ design cuts circuit thermal noise in half! VLZ demands high current — which requires a beefy power supply. So we give you one — and it's internal, too. (No clumsy wall-warts!)

**60dB GAIN** on first 4 chs. via balanced XLR mic inputs.

**ALL INPUTS & OUTPUTS BALANCED** (except RCA-type tape inputs).

Balanced lines let you run long cable distances (longer than 15 ft.) with minimal hum and buzz. For short cable runs you can also use unbalanced lines, if ya got 'em.

**EFX TO MONITOR**

switch and level control on Aux Return 1. When you're using the output of Aux Send 1 to feed stage monitors, you can now blend reverb or other effects back into the Aux Send 1 monitor mix, just like with our SR Series.

**Global AUX 1 PRE/POST**

switch. Aux Send 1 on each channel can be pre-fader/pre-EQ (great for stage monitor mixes), or post-fader/post EQ (for effects in the studio).

**CONTROL ROOM/PHONES SECTION**

with level control. A mini-version of a popular 8•Bus feature, that adds boocoo monitoring, mixdown and metering flexibility. Separate switches let you select any combination of Main Mix, Tape In and Alt 3-4 signals for routing to the Phones and Control Room outputs and meters. Perfect for creating custom headphone mixes, monitoring tape levels, etc. Plus, an extra button lets you re-route this multi-source signal back to the main mix!

**LEVEL SET MARKER**

When used with PFL/SOLO, the level set procedure gives you low noise, maximum headroom and best dynamic range every time! No more guessing about how to set your gain trims, no more worrying about internal clipping!

**PFL SOLO**

makes level setting easy. Just push a solo button, watch the famous Rude Solo LED start blinking, and adjust the trim control (ch. 1-4) for 0dB on

the meters. Solo also replaces your source selection, feeding the control room and phones (see 6). It's great for previewing or cueing a signal prior to

adding it into the mix. And remember, this solo is non-destructive. It doesn't interrupt the main left/right, 1/4" TRS or XLR outputs.

# FEATURES AND 8-BUS VLZ CIRCUITRY. THE CLASSIC MS1202 MIXER EVEN BETTER.

**7 3-BAND EQ** on all chs.  
You asked for it.  
Musical EQ at 12kHz,  
2.5kHz and 80Hz, like on  
our CR-1604 &  
LM-3204.

**8 LO CUT  
FILTER**  
(Chs. 1-4).  
With the  
exception of  
bass guitar, low  
frequency synth  
sounds and kick  
drums, almost all sound  
is in the audio range above  
75Hz. Our Lo Cut Filter  
reduces or eliminates  
unwanted frequencies below  
75Hz. It's great for cleaning up  
the "mud" in recording and live  
sound work, and also lets you  
boost lower vocal ranges  
without  
increasing  
stage  
rumble,  
bass guitar,  
etc. It's like  
having a  
second Lo  
EQ control  
centered at  
a higher  
frequency.

**9 BALANCED XLR MAIN  
OUTPUTS** (along with  
balanced 1/4" TRS output  
jacks). XLR outputs have a  
switchable 30dB pad to match  
the input sensitivity of  
camcorders and other mic level  
inputs.

**10 RCA TAPE LOOP  
INTERFACE** provides  
convenient hookup to tape  
decks and other devices.

**11 A MUTE ON EVERY  
CHANNEL PLUS AN  
EXTRA STEREO BUS!** As on  
our CR-1604, pressing a MUTE  
switch UNassigns the channel  
from the main L/R bus and  
reassigns it to the Alt 3-4  
output. You can create two  
stereo pairs for output to a  
4-track, bounce multiple  
tracks onto 2 more tracks, or  
preview a source that's not in  
the main mix yet.

**12 VIRTUAL PAD** on first 4  
channels" line inputs.  
10dB attenuation with trim all  
the way down; Unity at 9:00  
instead of 12:00 so you can add  
even more equalization to  
already-hot signals.

For 5 years, our Micro Series  
1202 12-ch. mixer has toured  
with superstars, gathered  
network news, pinch-hit  
next to mega-  
consoles...

and has  
been the ultra-  
reliable main mixer in a lot of  
home studios.

All that time, we've been  
reading warranty cards for  
suggestions on how we could  
improve the MS1202.

This is the result. Same great  
value. Same rack-mountable,  
built-like-a-tank construction.  
But with some exquisitely handy  
new goodies that make it an even  
more effective tool for both  
recording and live performance.

Visit your Mackie dealer (the  
MS1202 VLZ's in stock right now)

# BUYER'S GUIDE Mixers/DAs

BY RANDY ALBERTS & DEBBIE GREENBERG

## MIXERS

Assuming you've spotted, in these pages, more than one device that you'd like to add to your noise-making rig, you're going to need a mixer. So... While it's true that countless *Keyboard* readers own studios equipped with 24-channel (or larger) boards, due to lack of space, we were forced to limit our coverage of mixers to those with eight buses or fewer. We focused on the most vital statistics: the number of channels, bus outputs, auxiliary sends, and stereo returns. The list is organized in alphabetical order by manufacturer, with each of their product lines arranged by price.

Since mixers are rather feature-laden beasts, we have to apologize for the bare-bones nature of this list. Midway through the process, one manufacturer pointed out that we should have included tape returns as well. True enough—but it was too late to send out a whole new set of questionnaires. So treat the information below as a starting point in your search for the right mixer. Contact the manufacturer (see the address list on page 162) to obtain a mixer's complete specs. Despite repeated requests, a few manufacturers did not send us any information on their mixers, so we were not able to include them.

## DAT RECORDERS

The land of DAT decks includes both portables suitable for field work and powerful rack units. What follows is a bare-bones listing of the currently available DAT models; we have noted battery operation, if it's supported, and digital I/O (AES/EBU, S/PDIF, or both). We also allowed each manufacturer to give us a (very) brief description of important features.

## Fostex

D-5: three sampling frequencies, TOC functions, ID facilities, 1 bit converters, AES/EBU & S/PDIF, \$1,475.  
 D-10: built-in 8MBit RAM, instant start & scrubbing, optional sync card for timecode reading and RS422, AES/EBU & S/PDIF, \$2,895.

## JVC

XD-21010 TN: coax & optical digital I/O, includes remote, K2 interface with 4th order noise shaper, \$1,700.  
 XD-P1PRO: digital I/O, portable, SCMS-free, three-hour battery operation, micro remote included, selectable between 32, 44.1, and 48kHz record and playback modes, \$1,750.

## Otari

DTR-8: switchable between +4dBu and -10dBV, 32, 44.1 & 48kHz, 300x play speed search, AES/EBU & S/PDIF, \$2,000.  
 DTR-90T: built-in synchronize and timecode reader/generation, all channels (including timecode) independently recordable, AES/EBU & S/PDIF, \$10,393.

## Panasonic

SV3700: shuttle wheel, remote included, high performance A to D converters, digital I/O, \$1,695.  
 SV4100: instant start, external sync capability, remote included, enhanced digital interface, digital I/O, \$2,795.

## Sony

TC-D8: portable, battery operation, digital I/O, \$799.  
 DTC-A7: studio recorder, digital I/O, \$1,099.  
 DTC-A8: four-motor direct drive mechanism, super bit mapping in A/D circuitry, digital I/O, \$1,395.  
 PCM-2600: rack-mounted, four-motor direct drive mechanism, super bit mapping in A/D circuitry, read after write monitoring, AES/EBU, \$1,795.  
 PCM-2800: rack-mounted, four-motor direct drive mechanism, super bit mapping in A/D circuitry, read after write monitoring, AES/EBU, \$1,795.  
 TCD-D10 Pro 2: portable pro DAT, battery operation, four D.D. motor mechanism, AES/EBU, \$4,000.

## TASCAM

DA-20: entry-level DAT recorder, defeatable SCMS, user-bit accessible, S/PDIF, \$1,099.  
 DA-30 Mk. II: shuttle dial, selectable copy ID, S/PDIF & AES/EBU, \$1,599.  
 DA-P1: portable, SCMS-free, balanced inputs, built-in limiter, battery operation, S/PDIF, \$1,899.  
 DA-60: synchronizable, four heads, preview feature for instant record start, AES/EBU, \$6,299. ■

**Your shrink doesn't listen to you.  
Your boss doesn't listen to you.  
Even your dog doesn't listen to you.**

**We hear you.** Introducing the new standard in synthesizer modules: the Roland JV-1080. The module which has the features you've been asking for and some you haven't even imagined yet. For starters, it has 64-note polyphony, is 16-part multitimbral and comes with 512 of Roland's newest and hottest patches. It's also ultimately expandable, taking up to four SR-JV80 Series 8 Mbyte expansion boards simultaneously. An additional SO-PCM Series wave card can be added which gives you a whopping 42 Mbytes of internal ROM. That's over 1500 Roland patches at your fingertips. It's more performance power than was possible ever before.

With the optional M-512E Memory Card, you can store an additional 128 user patches.

We heard you when you asked for effects. In addition to global reverb and chorus, the JV-1080 has 40 insert effects combinations including rotary, dual pitch shift, tempo delay which syncs to MIDI clock, Hexa-chorus, distortion, and even multiple effects like overdrive/flanger.

If that weren't enough, we made it easy to use and gave it a General MIDI mode so it's compatible with the world of Standard MIDI Files (SMF). You asked for extensive synth editing parameters. We heard you. So the JV-1080 has 10 advanced tone structures and even LFOs that sync to MIDI clock.

But perhaps best of all, the JV-1080 has a surprisingly affordable price. Which should be music to your ears.

Haven't you waited long enough? Visit your nearest Roland dealer today and ask to hear what you've been asking for all along: the JV-1080. Or call (800) 386-7575 and select 3 to receive an exciting, full-color brochure. Think of the JV-1080 as our way of letting you know we hear you. Loud and clear.

# MIDI CONTROLLERS, PROCESSORS, RETROFITS, & STANDS/CASES/BAGS

BY RANDY ALBERTS & DEBBIE GREENBERG

Sometimes it seems nothing is beyond the reach of MIDI. In this grab-bag section of the Buyer's Guide, we present comprehensive listings of MIDI controllers (both master keyboards and alternate controllers), data processors from mergers to whatever, and retrofits for older analog synthesizers. To round out the proceedings, you'll find a variety of keyboard stands and cases suitable for both road and studio. (For your reference, KR stands for Keyboard Report.)

## MIDI CONTROLLERS

Wanna make noise with MIDI? Here's a list of MIDI controllers, including master keyboards, strap-on keyboards, MIDI wind controllers, and alternate controllers. (Drum- and percussion-related MIDI devices are covered in the Plug-In Percussion section on page 103.) We had only enough space to provide you with a brief description and retail price of each controller; for more information, use the address list on page 162 to contact the manufacturers.

### Peavey

**PC 1600:** general purpose MIDI controller with 16 sliders, 16 buttons, data wheel, two CV pedal inputs, 50 presets, and 100 scenes; transmits any system- common or sys-ex message, \$349.99. KR: Sept. '93.

**C8p:** 88-key MIDI controller keyboard with two MIDI ins and four MIDI outs, 240 x 64 graphic display, 64 presets, eight zones per preset, and programmable velocity curves, \$1,599.99.

**C8:** same as C8p, but with disk drive, \$1,999.99. KR: Sept. '92.

**Cyberbass:** bass guitar MIDI controller with wired-fret technology, fast and accurate tracking, 32 performance presets, high-quality electric bass, \$1,799.99.

### Penny & Giles

**MM-16 MIDI/Workstation Controller:** MIDI management systems and DAW controller with 16 endless-belt controllers, 64 program memories arranged in eight banks of eight for rapid access; can operate as a stand-alone generator of MIDI codes or in update mode, providing automation when linked to sequences and similar external equipment, \$2,500.

### RiCharde & Company

**Charlie Lab Digitar:** intuitive controller for creating strummed guitar parts; user sends MIDI note information to the Digitar from a MIDI keyboard or sequencer, then strums the Digitar's "strings"; the Digitar outputs note information according to the strumming, complete with performance dynamics, \$449. KR: May '95.

### Riday Systems

**T-91 MIDI Controller:** patented, unified keyboard allows for identical fingering in all 12 key signatures; "strap-on" unit, \$1,395.

### Rolls Corporation

**RFX 93 Patchwork:** MIDI switching control, provides MIDI control over four stereo effects loops, four latching switch functions, and A/B functions; front-panel control as well as MIDI; 128 presets, \$199.99.

### Softwind Instruments

**The Synthophone:** MIDI wind controller built into an alto sax body; has extensive harmonizing capability (up to five-part multitimbral); sends all common continuous MIDI controllers in scalable amounts; upgrade via EPROM exchange; stores 32 master patches, \$3,850. (see Alternate Controllers column, Jan. '90.)

### Stick Enterprises

**The Grid:** a version of The Stick, a two-handed tapping fretboard with customized Roland guitar MIDI interface, 10-string model: \$2,300; 12-string model: \$2,600.

### Vicknair

**Midimonic:** five-octave pitch-to-MIDI converter with dynamic or fixed velocity; has built-in mic, diatonic and chromatic scales, two speed selections, four MIDI channels, selectable long- and short-note

release, and selectable down transpose, \$239.

### Waldorf TSI GmbH

**MicroWave and Oberheim Matrix-1000 Programmers:** real-time editing while sequencer is running; spontaneous, intuitive programming; clear, logical design; edits may be recorded; easy adaptation of sounds, \$590.

### WaveAccess

**WaveRider Jr.:** converts brain, heart, muscle, and skin signals into MIDI output; three channels of biological input; Windows software; all accessories included, \$750.

**WaveRider Pro:** same as WaveRider Jr., but with five channels, \$1,500.

**WaveRider Max Pro:** uses Opcode's Max environment to convert brain, heart, and muscle input to MIDI, \$1,800.

### Yamaha

**CBX-K1 MIDI Keyboard:** extensive control of all XG-format parameters, 37 velocity-sensitive mini keys, compact for desktop use, MIDI merge function, \$199.95.

**WX11/BT7:** MIDI wind controller, \$505.

**WX11 Set:** MIDI wind controller with WT11 tone generator, \$995.

### Zeta Music

**RetroPaks:** Violin, Viola, and Cello: allows an acoustic instrument to control synthesizers with the addition of the Zeta RetroPak bridge; Zeta MIDI System is required to interface with a synthesizer. Violin: \$1,095; Viola: \$1,195; Cello: \$1,495.

**Jazz MIDI Violin, Viola, and Cello:** Violin and Viola available in four- and five-string configurations; Zeta MIDI System is required to interface with a synthesizer; can include wireless components for analog audio out, Violin: \$2,595; Viola: \$4,495; Cello: \$6,595.

**Zeta MIDI System:** enables Zeta MIDI instruments or Zeta RetroPaks to interface with MIDI synthesizers; tracks a string player's dynamics, pitch, and vibrato on each string; includes single rack-space MIDI brain, five-position footswitch, and all cables, \$2,295.

**Mark O'Connor Signature Series Violin:** MIDI-compatible, limited-edition electric/MIDI violin, four- or five-string; can include wireless components for analog audio out, \$3,495.

## MIDI PROCESSORS/PATCHBAYS

Even when we eliminate (for reasons noted elsewhere) the MIDI patchbays and similar items that need to be hooked up to a computer to operate, there's still quite a variety to choose from.

### Anatek/Creation Technologies, Inc.

**Pocket Thru:** MIDI thru box, no batteries or AC power required, stackable for multiple outs, handles all MIDI data, \$49.

**Pocket Merge:** 2 in/1 out MIDI merge box, no batteries or AC power required, stackable for three or more inputs, handles large data volume, \$89. KR: Aug. '89.

**Pocket Sync:** 1 in/1 out synchronizer, translates MIDI clock into FSK tone, FSK tone to MIDI clock; smart FSK allows starting anywhere in song, \$99. KR: Feb. '92.

**Wind Machine:** 1 in/1 out breath controller interface, converts Yamaha BC-2 output into MIDI data, \$119. KR: Jan. '93.

**MIDIMatch System:** 1 in/1 out per box, long distance MIDI transmission booster, two-box system for running MIDI signals up to 4,000 feet, bi-directional, \$159.

**Studio Merge:** 8 in/1 out MIDI merge box, each input has its own MIDI thru, merges up to 128 MIDI channels, handles large volumes of MIDI data, \$399.

### Aquila

**MT2 MIDI Transmitter:** optional add-on to either MR-2 or MR-1 system for PianoDisc and MIDI Player Piano, \$445.

# What went through our minds when we designed the XP-50 Music Workstation?

## Everything.

### Hyperactive Reflexes

A 32-bit RISC (Reduced Instruction Set Computer) chip gives the XP-50 lightning fast and accurate response to performance data.

### Sensitivity Core

A 61-note velocity and aftertouch-sensitive keyboard and newly-designed modulation lever help you add feeling to every performance. A large 40-character, 2 line backlit LCD makes visibility and data editing more efficient.

### Right Brain Function

Loop, pattern and linear recording let you be creative without interrupting your thought and musical processes. **Pattern Paste** and the ability to create 100 customized patterns provide even more options.

### Nerve Center

The newly designed **MRC-PRO sequencer** has 16 primary tracks which are each capable of controlling 16 MIDI channels. New Grid, Shuffle, and Groove quantize functions let you instantly adjust the feel in precise increments in realtime.

### Memory Center

The XP-50 nerve center is enhanced with **640 preset patches**, 96 preset performances and 10 preset rhythm setups. When fully expanded, it can remember up to **1750 onboard patches**.

### Vocal Capacity

**64-voice polyphony** and **16-part multitimbral** capability handle even the most demanding multi-instrument arrangements.

### Pattern Recognition

**Realtime Phrase Sequencing (RPS)** allows patterns to be assigned to individual keys and **instantly triggered** for live performances, remixing, or spontaneous improvisation.

### Aural Receptors

**Ten tone structures** allow access to two wave generators, multiple time variant filters and amplifiers, a ring modulator and booster. High-quality effects include eight reverbs, chorus and **40 insert effects** like two voice pitch shifter, rotary, time controlled delay and distortion/flanger.

### Linguistic Skills

The XP-50 has a **General MIDI mode** for playing commercial Standard MIDI File (SMF) song data. It also converts to the ways of other great minds like Super and original MRC formats.

### Instant Recall

**Play songs** from disk in **realtime** without the typical load and wait time of other workstations.

### Memory Overload

The XP-50 comes with a full 8 Mbytes of Wave ROM. It also accepts up to **four 8 Mbyte SR-JV80 Series wave expansion boards simultaneously** for a total of 40 Mbytes of sound.

### Common Sense

The XP-50 will blow your mind. For anyone with a head full of ideas, it's the only workstation you should be thinking about. **Call (800) 386-7575** to order our **1995 New Products Video** (\$9.95) featuring the XP-50 Music Workstation.

## STANDS, CASES, GIG BAGS, etc.

Okay, you've read enough of the Buyer's Guide to decide what gear you want to buy. But don't forget to budget for a few unglamorous essentials — you know, odds and ends like keyboard stands, cases, gig bags, covers, and studio furniture. Those are the items you'll find below. Of course, a list of this nature has to have limits, so we said "no can do" to items like racks, microphone stands, and music stands (unless they were part of a keyboard stand). Check the following list to find brief product descriptions and retail prices, alphabetized by manufacturer. (In some cases, we give a price range of least expensive to top-of-the-line.) A couple of well-known manufacturers failed to send us any info on their product lines, in spite of repeated requests.

### BCK/Forefront

Anti-Static Keyboard Covers: nine models fit all major brands of keyboards; see-thru translucent vinyl to see keyboard status lights; protects against liquid, dust, dirt, and static electricity, \$12.50-\$24.50.

### Calzone Case Co.

Universal LD-ATA Keyboard Case: 4114, 42" x 14" x 4.5"; will fit Casio VZ-1, CZ-1, FZ-1, Ensoniq ESQ-1, EPS, ASR-10, SQ-80, TS-10, Kawai K3,

**This is your  
equipment on a

***And this is Furman's new PRO Series:  
Absolutely the best protection you can get.***

**H**ow does a new Furman PRO power conditioner keep your equipment out of the frying pan?

Simple. The PRO Series gives your equipment the industry's most comprehensive protection against damage from power problems. No other brand even comes close.

All three Furman PROs are rated at 20 amps/2400 watts, more than enough capacity for your project studio or touring rig. And that's just the beginning.

*Only the PRO series uses all these protection components*

Every Furman PRO utilizes a unique combination of MOV's, gas discharge tubes, fast-blow fuses, high voltage inductors and capacitors and high-inrush magnetic circuit breakers. That means a Furman PRO can safely absorb and dissipate a whopping 11,000 amperes of spike/surge current in any mode, even from a nearby

lightning strike. And a Furman PRO is unmatched at preventing noise from fluorescent lights and other electronic pollution from leaking into your music.

Here's another Furman PRO Series exclusive you'll really like: Extreme Voltage Shutdown. Your PRO will not turn on if it senses abnormal mains voltages. If it's already on and detects that your voltage is too high or too low, the PRO shuts down power to its outlets, instantly. No damage to your equipment, no damage to your PRO. When the mains

*You always know your power and protection status before your equipment is switched on*

voltages return to normal, the PRO instantly restores clean, conditioned power to your equipment.

**T**here's a new Furman PRO for every need: The PL-PRO (top) features an AC voltmeter with flashing alerts for marginally high or low voltages, and new precision-machined, dimmer-controlled rack lights that automatically switch off when either light tube is pushed in. The PM-PRO (left) is for applications where lights aren't needed — it adds an RMS-reading AC ammeter along with the voltmeter. The PS-PRO (right) applies and removes power from its outlet groups in a variable timed sequence, and alerts you to wiring faults with neon indicators.

All Furman PRO models provide LEDs to indicate Protection OK, Ground OK and Extreme Voltage Shutdown, widely-spaced rear outlets for "wall warts," and a 10 foot long, heavy duty, 12 gauge cord.

If you require PRO level power conditioning for more than one 20-amp circuit, ask for our data sheet on the new Furman PowerPort Remote AC Controller. Any number of PowerPorts can be easily networked for control and monitoring from multiple locations.

Your sound should sizzle. Not your equipment. Call or write us today — we'll send you a free color catalog.

# BUYER'S GUIDE SOUNDS

CD-ROMs, SAMPLING CDs, & PATCHES  
BY RANDY ALBERTS

In the five years since *Keyboard's* first Buyer's Guide, no product category has burst a seam more than sounds. We know it's not because creative keyboardists are less inclined to come up with their own sounds than they used to be. Maybe it's because you need the latest sounds to play in the latest styles, and a whole new breed of specialists has arisen that knows how to nail those sounds. Or maybe it's because samplers with capacious memories make it easier than ever before to slap a CD into the drive and get mixin'. For whatever reason, third-party sound developers have multiplied like tribbles.

In the following pages, sound developers and distributors are listed alphabetically followed by the sounds they sell. For each product, the name, price, and media (CD-ROM, audio CD, ROM cartridge, floppy

disk, etc.) are listed, along with — where applicable — the specific sampler(s) or computer(s) the sounds are formatted for.

You'll notice some listings followed in parentheses with "also sold by" for those products sold by more than one company. This is the case with audio CDs and CD-ROMs that are developed and marketed by one company and also sold by other distributors. The product appears under the primary developer/distributor's section in the listings, followed by the names of other companies that also offer the product in their catalog. In particular, East-West Soundwarehouse distributes the work of a number of European developers in the U.S. and Asia, but contact information is also included (in the address list beginning on page 162) for the developers themselves, for the benefit of our European readers.

## That's right!

**As a valued KEYBOARD reader, you are entitled to a  
FREE CD-ROM catalog - no strings attached.**

Just send in the attached coupon (photocopies and facsimiles not accepted), and our friends at EAST-WEST will send you their interactive catalog on CD-ROM (Mac/PC) – Absolutely FREE! This really cool tool allows users to preview a selection of over 500 titles, all of which are categorized by musical style and sampler format.

When you get your CD-ROM (allow 4 to 6 weeks for delivery), just select a format (CD or CD-ROM), then a category (Brass, Dance, Rhythm, etc.) - only products in that category will be shown. Click on the CD cover of your choice and a full screen will appear giving you all the information about the product. You can print the info and listen to the demos too (8/16 bit). If you have any questions, call EAST-WEST toll free at 800-833-8339.

TITUS LEVI

**Name:** Guido Zen. **Style:** This is my music: industrial metal (with the band Crime Of Normality). **Age:** 22. **Influences:** Peter Gabriel, NIN, Tangerine Dream, various hard rock bands.

Massive Attack. **Main Instruments:** Akai S3200, Yamaha SY77, Macintosh IIsi w/Steinberg Cubase 2.5. **Contact:** Via XXIV Maggio, 12, 00046 Grottaferrata (ROMA), Italia.

**Name:** J. Sebastien Coté. **Style:** Atmospheric neo-electronic. **Age:** 25. **Influences:** Tangerine Dream, King Crimson (later period), Bach, Rush, Laurie Anderson, Brian Eno, Peter

Gabriel, U2, Bill Bruford, Miles Davis, Pat Metheny Group. **Main Instruments:** Kurzweil K2000S, Yamaha DX7IId, TX81Z, Roland D-50, SPD-8, and TR-909, Korg M3R, Poly-800 and MS10, Atari and Mac computers. **Contact:** CP 66021, Quebec, Canada, G1R 1P8. JSC@cmq.qc.ca.

When I get recordings for Discoveries, I listen before I read anything. And after listening to the music of Sebastien Coté and Guido Zen, I was amazed to find that both are under 25 (at least when they produced their tapes). And that amazement is not at how good they both are — inspiration and excellence can be wielded by a teenager — but, rather, at the depth of their musical languages. Each has assimilated a wide-ranging and eclectic mix of influences and a seamless facility with these materials.

**Coté**, a largely self-taught percussionist, took up keyboards in the '80s, pulled in by the gravity of computers, synths, and electronics. "I'm not really a 'keyboardist' in the formal sense, but rather a 'key presser!'" Even so, his 1993 cassette album *Mirador* demonstrates adequate comfort at the keyboard (particularly on "Die Antwort") and a remarkable knack for "pressing" the right keys at the right time. Developed

perhaps from years of playing percussion, his phrasing is smooth and energetic from start to finish. In fact, he's one of those rare musicians who never seems to drop the ball. And given that he's approaching the keyboard as a "pressing" of different keys, the outcome is all the more impressive. Everything seems perfectly in place: the vast array of percussion instruments and samples, the arpeggios (when they're there), the solos, and the melodies (which are full of wonderful rhythmical and intervallic surprises).

The even younger **Zen** (admit it, it's a catchy name) actually performs two different styles in two different contexts. Most of his musical effort goes into the band Crime Of Normality. But when one of the players moved to England and the rest (including Zen) went into the Italian national service (sort of civil service by conscription — could you imagine this in the States?!), he took time to put his own projects together until the band could be reunited in London.

The first of these projects, *Floodlight of Myself*, is like Coté's music in that it throws all sorts of elements in the pot. However, Zen is much more of a melodist. His melodies are sweet, sustained, dreamy, melancholy, and wistful. Yet he casts a frame around the melodies that throws a fiercer and more aggressive energy into the music. North African hand drum loops pop up here and there, drones evoking everything from evening prayers to industrial alleyways lurk and creep, and pointed, sharply cut bass and countermelody lines punctuate the pieces. Zen brings laughing and crying, pain and pleasure, yesses and nos wonderfully and yet uncomfortably close to one another.

With so much ability, what will they do next? Well, Zen is working on more of his solo music (including the tape *Moving Through Changes*) and looking forward to relocating to England this winter. (The Italian address is still valid, though.) "In Italy our kind of music doesn't have many opportunities. It is the style, but also we sing in English. Even so, our demo, *Still Around*, got some attention and good reviews. But mostly, I like the way of London."

Coté has some hopes but no immediate plans for new product. He has started on a new cassette — wearing his percussionist hat — with one of his accompanist colleagues at the l'Ecole de danse de Quebec for the classes at the school. "At the school I have to keep things simple because I move around so much." And that simplicity also permeates his

music. "I've been listening to a lot of the ambient Eno music. And my music is slowing down and the drumbeat is less emphasized. The beat is still important, though. Even if it's not right there, the beat can be there in the delays and sequences. I even bought a guitar just to add more sustained sounds, and I 'bow' it with a knife to emphasize the texture. It makes my palette much more wide."

## SHORT TAKES

**Name:** Charles Tobermann. **Style:** Contemporary Classical meets the Middle Ages somewhere in the Indian Ocean. **Influences:** (3Bs)<sup>2</sup> (Bach, Beethoven, Brahms and Bartók, Berg, and Boulez), Patsy Cline, the Benedictine Monks of Solesmes, the monks of the Temple of Buddha's Tooth in Kandy (Sri Lanka), John Coltrane, Bill Evans, Elliott Carter, Muddy Waters, Pope Gregory, Charles Ives, Mississippi John Hurt. **Contact:** La Claire Productions, 7 Bd. de Grenelle, 75015 Paris, France.

Tobermann serves up a rare musical blending of heady, dense rhythms and timbres with a rich, globally minded rhythmical framework. His short CD *Getting to Know Each Other* is at once disciplined and suave, sweet and prickly. Those who enjoy everything from soundtrack music to modern electronic composition and even new age will find gratifying moments as well as pleasurable surprises throughout the disc.

**Name:** David Gilden. **Style:** Hi-tech world folk. **Influences:** Mandinka music, late '70s electronic music, various classical ditties. **Contact:** 62 Capitol Street, Watertown, MA 02172.

On his 1991 CD release *Ancestral Voices*, Gilden presents a gentle, inviting mix of Indic, African, Mediterranean, new age, and jazz musics. Of particular interest is his integration of the Kora into a largely electronic soundscape. For those who don't know, the Kora is an instrument that resembles (in sound and appearance) a cross between a harp and a big lute, and is mostly played in Gambia and Mali. Gilden comes out of the Mandinka style from Gambia, where the instrument is often used for self-accompaniment by story-telling historians called griots. The sound is radiant, fluid, and unhurried, and this spirit permeates all 14 pieces on the CD, including those that have nary a whit of Kora playing in them. ■

Titus Levi, founder of the California Outside Music Association, spends his free time struggling through graduate economics courses at U.C. Irvine. If you'd like to appear in Discoveries, send a cassette or a CD of your best material, a letter indicating your full name, age, style, influences, performance credits, goals, and equipment, a publishable phone/fax number and address at which readers may contact you, and a clear black-and-white photo of yourself with your keyboard setup. Photos should be labelled with your name and the photographer's name and address. All styles of music will be considered. Due to number of submissions, material cannot be returned, and applicants will not be contacted unless accepted. Send all correspondence to Titus Levi, 5153 Hanbury St., Long Beach, CA 90808. # What do you like best about your DA-88?

"Built-in headroom. It makes a big difference when you're trying to track quickly."

"The TASCAM unit is clearly more dependable."

"I like having the A/D and D/A converters on an interface card because you can drop in a new card without having to disassemble the whole machine."

"MIDI syncing is so easy and clean. It's hard to know where the virtual recording ends and the taped recording begins."

"I've had a lot of experience with TASCAM... the dependability and the value. It was a no risk investment for us."

"With the sync card it's so easy to synchronize our audio both to video and other audio reels, including our DAT reels."

"It sounds great. Especially in the upper frequencies."

"The 108 minutes of recording time means we can do something we never could before — get an entire performance on a single piece of tape."

"Bouncing. I can bounce forever, it seems. The DA-88 just doesn't distort like other digital decks."

"The sync card has built-in SMPTE, video sync and Sony 9-pin. Perfect for our video house."

"Our DA-88 ended up in a pile on the floor after the earthquake. I put it back together, turned it on, and it worked fine. It's earthquake proof."

"We really like the convenience of the Hi8 format. You don't get tape stretch, you get much more time per tape, and it's really cost-effective."

"The Hi8 format is a superior recording medium, and it's a TASCAM."

"I can't help but notice the difference in the sound. Unbelievable."

"It's trouble free. All I have to do is clean the heads. I'd call it the stress-free modular digital multitrack!"

"I needed over an hour and a half recording time. The DA-88 is the only digital recorder to offer that."

"The frame accuracy is so fantastic, I can edit voice-overs and guitar parts as small as two frames using the Absolute Time capability."

"Punching in and out is so simple. That fact alone made it worth buying a DA-88."

"The punches are very clean and accurate. A dream."

"I've been on the DA-88 nonstop for three weeks now. The transport is phenomenal."

"I like the size, the editing capabilities, and the price. I even like the way it looks."

"I just finished scoring two movies on it. Unbelievable machine."

"Two things. First, the DA-88 gives me a full one-hour and fifty minutes of record time. Second, the wind times are so wonderfully tight and quick... it takes my other digital recorder a day and a half to rewind."

"I like the auto-locator and rehearsal modes, and of course we're doing our next album on it."

"I can now offer my customers digital recording at analog prices."

"It's just faster. Speed counts. Time is money."

"It just feels better than any other recorder in its price range."

"We love the jog/shuttle wheel. It's working out great."

## No wonder the DA-88 is the preferred digital multitrack.

It features the latest generation in digital multitrack recording technology. According to users, it's the best sounding, best built, most functional and affordable digital multitrack on the market.

You're going to love the DA-88. Get to your dealer now and see why!

"It's the name. They make the best recording equipment, period."

"I wanted the serious machine for music production. That's TASCAM."

"I can lock it to video and my analog machines with no hassle. Life is so easy now that I have my DA-88."

"I'm focused on the TASCAM. It will become the standard. And I don't want to be left out."

Why was Depeche Mode noted simply as an "honorable mention" when they've been one of the toughest synth pop bands to undergo the changes of the '80s and '90s? FRED HERSCH

## Cool Sounds for a "Silent Night"

**S**eaon's greetings from Solo Piano. In keeping with the season, here's my arrangement of a beautiful holiday melody by Franz Gruber, "Silent Night." I've tried to strike a balance between traditional harmony and jazzier changes, incorporating some

of the things I've mentioned in previous Solo Piano columns, such as substitute chords, four-part harmony, voice leading, and voice balance.

Try this approach for learning the piece (this works for learning just about *anything* at the piano):

1. Split the voices in the treble staff between your right and left hands, ignoring the bass staff.

2. Split the voices of the bass staff alone between your right and left hands.

3. Play the melody alone.

Slowly and tenderly ♩=72

1

mp

Musical notation for measures 1-6 of "Silent Night". The key signature has three flats (B-flat, E-flat, A-flat) and the time signature is 3/4. The notation is for piano, marked *mp*. The melody is in the treble staff, and the bass staff provides harmonic support with chords and single notes.

7

*poco rit. . .* *a tempo*

Musical notation for measures 7-12 of "Silent Night". The notation continues from the previous system. Measures 7-8 are marked *poco rit. . .* and measures 9-12 are marked *a tempo*. The melody continues in the treble staff, with the bass staff providing harmonic support.

13

Musical notation for measures 13-18 of "Silent Night". The melody continues in the treble staff, with the bass staff providing harmonic support.

19

Musical notation for measures 19-24 of "Silent Night". The melody continues in the treble staff, with the bass staff providing harmonic support.

25

Musical notation for measures 25-30 of "Silent Night". The melody continues in the treble staff, with the bass staff providing harmonic support.

4. Play all the voices except the melody.
  5. Play the entire piece as written.
- An optional but highly recommended step is to transpose individual phrases or the entire piece.

This step-by-step approach will insure that

you'll really hear all of the voices as they move. When performing the tune, take a nice leisurely pace, don't over-pedal, and remember to balance all of the voices.

Wishing you a happy, healthy, and musical New Year! ■

*Fred Hersch's trio and quintet can be heard on his latest release, Point in Time (Enja). The disc features new originals and fresh arrangements of classic standards and tunes by Wayne Shorter, Jimmy Rowles, and Thelonious Monk.*

**T**here comes a time in every writer's life when you're just not firing on all eight cylinders. Maybe you've been writing too much, maybe you've been away from the keyboard too long. Maybe it's biorhythms. The tides. Solar winds.

No matter. Creativity flows in cycles, and this sort of mental stagnation clogs every brain now and then. When my sludge builds up, I blow out my tubes with a little system that really works.

It takes two weeks, and requires both a bit of discipline and a sense of play. It's like boot camp for composers, but if you embark on this adventure you'll wind up as a lean, mean composing machine with a whole bunch of new ideas. I'll illustrate the system with songs, but you can apply it to any style of music, be it chamber music, new age, or jazz.

### Twelve Steps to Heaven

Here's what you do: On each of 12 little slips of paper, write down the name of one pitch of the chromatic scale, A, B $\flat$ , B $\natural$ , etc. Put them in an envelope labeled "KEYS."

Next, on each of 12 more slips of paper, write down 12 styles of music or the names of 12 artists you'd like to write for. In the past, some of my styles have been Bordello New Orleans R&B, Queen Latifa Mid-Tempo Rap, Whitney Houston Gospel Ballad, Garth Brooks Country Rock, Broadway Show Stopper, and Boyz II Men Doo Wop. Get the picture? Slip these into an envelope marked "STYLES."

I suggest that you pick styles you wouldn't ordinarily write in, but don't pick a style that you have contempt for either. You have to have heard at least one tune in a style that has knocked you out, and you should be a little challenged by writing in the new style. For instance, if a lot of your stuff typically sounds like Nine Inch Nails, don't pick that style as one of your choices.

Finally, write down 12 subjects you are intensely interested in. Look hard. Don't make them all different aspects of your wonderful new lover. Try to search for people, things, places, and situations that have a sharp emotional charge for you. Some of my subjects in the past have included: Crime In The Street, My Mother, Baltimore (where I grew up), Dogs, and Cheesesteak Sandwiches. They can be light-hearted, but they should be something you care about. Slip these pieces of paper into an envelope marked "SUBJECTS." Set all three envelopes aside.

### Follow The Rules

Find a two-week period when you can set aside a couple of hours a day to write. The purpose of this is not to write the next hit single, though

Ex. 1. Altering your accompaniment figures slightly can inspire a wide variety of melodic ideas. This is a basic Texas-style shuffle. Simple yet rhythmic, this figure begs for a growling vocal sitting on a flat third.

Ex. 2. The same feel, but more active. The right-hand voicing makes this one sound more like a drum loop than a piano part. I hear a hook that takes my voice up into the stratosphere; how about you?

Ex. 3. This variation has a much more laid-back feel, even at the same tempo as Ex. 2. Picture Rickie Lee Jones mumbling a clever rhyme, always a little behind the beat.

you shouldn't completely dismiss the possibility of this happening. You'll be using unfamiliar styles, keys, and methods to force yourself into new places. Here are the rules:

1. Every day, draw from your envelopes a key, a style, and a subject. What you draw is what you get. No exceptions.

2. Flip a coin. Heads for major, tails for minor.

3. Write one song a day, no more, no less. A song is complete when you have a rough tape of the entire song and a written lyric sheet.

You must finish the song in one day. It can be a lousy song, or it can be a great song. But you must sing the whole song onto a tape and you must write down all the words. You can't leave out even one word or one chord. Them's

the rules. A song a day, no matter what.

### No Pain, No Gain

It's Day One. From your KEYS envelope, you draw B $\flat$ . Your coin toss comes up heads, so you're going to write in B $\flat$  major. From your STYLES envelope, you draw Bar Band Rock Shuffle, and from the SUBJECTS envelope you draw My Car. You say to yourself, "In the next two hours I will write a Bar Band Rock Shuffle about my car in the key of B $\flat$  major. [This is actually an assignment I once drew.] Even if a nuclear bomb goes off and I can't run my sequencer, I will write that song!"

You can start anywhere, with a chord progression, a feel on your drum machine, or a snippet

of melody. I like to start with words, then come up with a strong chorus hook that says what I want to say (about my car, in this case), and work backwards from there. You can start with a bass line and work your way up, or attack the assignment from any direction that appeals to you.

Let's say that in your first five minutes you come up with the title and hook to "Take Me to the Freeway." Sit down at the Steinway and play a rock shuffle feel. Play several variations of the feel, and notice how each one suggests a different melodic direction (see examples).

You'll probably start to generate a verse and chorus, get some lyrics and then . . . stop. At this point, you might ordinarily say, "I've done a good day's work. It's Miller time," and leave the rest of the song for another day. After all, you

wouldn't want to risk rushing the completion of a masterpiece.

Risk it, rush it. It's not a masterpiece, it's Day One. If a chord progression doesn't flow, force it. You will begin to consider desperate options, and out of those new directions will grow fresh ideas. When you have written a complete melody, chord chart, and lyric sheet, tape a rough vocal. Then and only then can you call it a day. Even if you have to write a bunch of "moon and June" lyrics or a less than original melody, just do it. Finishing the song will allow new thoughts to come through the next day.

#### Variations on a Theme

It's important that you have envelope categories that are stimulating. One time, instead of using

styles, I used pre-recorded drum tracks. Another time I just used artist names. The last time I did it for a whole month using both major and minor modes of all 12 keys.

Don't worry if your songs drift from the target style, or if a lot of them feel less than perfect. This is a training program. By the end of the two weeks, your writing will be loose and confident. Let me know how the system works for you, c/o *Keyboard*, and don't forget your new mantra: Finish the song! ■

*As a composer and songwriter, Richard Leiter has done projects for a wide variety of clients, NPR, Honda, Carl's Jr., ABC/TV, and Inglenook Wines among them. He writes and performs in California.*

Ex. 4. Same tempo and feel, but we're a world away from Ex. 1. The suspended third of the B $\flat$ 9add13 resolves in bar 3, adding tension and release to the accompaniment formula. No screaming here; how about something that touches on the 9ths and 11ths?

**On Sale November 7!**

It's come to my attention that there are still a few common misunderstandings about how to use SMPTE timecode properly when scoring to picture, so I thought it would be useful to go over a few of its peculiarities. Keep in mind that the correct use of timecode is one of the backbones of TV and film scoring. Do it wrong and you could end up in the unenviable position of having to rerecord an entire score. But fear not, intrepid wanderers, there are just a few points to ponder and a few myths to bust, and you can avoid a syncing disaster.

Any time you are asked to put music to picture, you should be given a videotape of the final edited version with a SMPTE timecode track on one of the audio channels. You'll need a decent stereo VCR to play the tape back. 3/4" tape machines have the advantage of including a special third audio channel exclusively for timecode. The channel with the timecode is patched to whatever device you use to lock your sequencer to tape. These days most every computer MIDI interface comes with timecode-reading capabilities. And while most interfaces can also generate timecode, this should be used for striping audio tape only. Don't make the mistake of thinking that you can put timecode onto a videotape as part of any film or video production; your timecode numbers will not match the numbers everyone else is using, and you will get yourself into trouble.

Most sequencers allow you to select the type of SMPTE timecode you will be syncing to. Set it wrong and your music may not sync up with everything else by the end of the post-production process. If you live in America (North or South), Asia, or a few other assorted continents, the timecode found on a videotape is running at 29.97 frames per second. No exceptions. Even if the tape is labeled "30 fps" or is in black & white (very arty these days), it really is still 29.97. Set your sequencer accordingly. Some projects use SMPTE timecode in a format called "drop frame" (sometimes labeled as "df") while others are done in "non-drop frame" (labeled as "ndf" or "nd"). While your sequencer may be able to tell these apart, you should double-check with whoever gave you the tape to be certain. Once again, be sure to set your sequencer accordingly. You'll be glad you did.

Feature films are, with virtually no exceptions, transferred to video with 29.97 non-drop

frame SMPTE timecode, while projects headed to television are virtually always post produced using drop frame timecode. Again, it's very important for you to check and confirm what is on the tape you get.

With the formalities of SMPTE timecode "flavors" taken care of, you're ready to start composing your score with your sequencer locked to your VCR. Each cue you write will have a "Start Time," sometimes called an "Offset," which will tell the sequencer exactly where in the film to begin. I suggest strongly that, even though you can do all your scoring while watching picture (your loyal sequencer flawlessly slaved to the tape), it's a good idea to give the video a rest from time to time and just write. This helps keep an organic feel to the music, so it doesn't become nothing but a slave to the picture. After you've gotten some notes out of your system and into your computer, set your sequencer to lock to the tape again and see how it fits the scene. Make your fixes and try it again.

When you deliver your music mixes back to the project's production company, there are quite a few potential variables that you need to take into account. Before you prepare to record your music, you should always talk to the people to whom you will be giving your music in order to be sure it is mixed in a format they're able to deal with. Digital 8-track recorders such as the Alesis ADAT and TASCAM DA-88 have become very popular ways to deliver music for film and TV. With these machines you can deliver mixes with two or more tracks along with SMPTE timecode. Most productions also want a track with the timecode that matches the music's placement in the movie, which are the start times you set on your sequencer. You must also include about 30 seconds of timecode prior to the start of the music (called "preroll") and 30 seconds past the end of the cue (called "postroll"). These are needed by the machines used to transfer your music onto the final master tapes. These tapes will also include dialog and sound effects. If you write a two-minute piece of music that starts at 01:07:12:05 (SMPTE timecode is noted in the format "hours:minutes:seconds:frames"), then you would want to deliver

your music on a tape with timecode that starts at approximately 01:06:42:00 and runs until 01:09:42:00. You should always leave 15 to 30 seconds between cues. Many TV shows now want the music delivered on an 8-track digital tape with one hour of continuous timecode starting at 01:00:00:00. Because these machines have excellent synchronization capabilities, the music does not need to go through a transfer to another master tape.

There is a convention used in films in regard to the hour number of the timecode. Films are broken down into several reels while they are being edited and mixed. Most all film companies make the SMPTE hour the same as the reel number, which makes it a little easier to navigate through the many tapes you may be working with. For example, a cue that starts a minute and a half into the third reel of the film would have a start time of 03:01:30:00. TV shows normally use a SMPTE hour of 01.

Speaking of film reels, it is often required that there be no music that crosses between the reels. This avoids the possibility of an audible glitch where one reel ends and the next begins. If you are uncertain about a piece of music that might need to cross over a reel change, check with the production people first.

I've had projects come in with the timecode mislabeled, and I've also been given wrong information by the editors. It's really important to check and double-check the information if you're the least bit unsure.

I hope you've enjoyed these oversimplifications as much as I've enjoyed paraphrasing them for you. Actually, if you remember these ideas, you may well be on your way to delivering a perfect master tape each and every time. Ignore me and pay the price!

If you want to learn more fascinated facts about timecode and how to avoid getting fired over it, let me recommend *Synchronization from Reel to Reel*, a book written by yours truly and published by Hal Leonard Books. The new, updated edition goes into far greater detail about all aspects of synchronization for video, film, and audio. You can find it in music stores, technical book shops, and specialty book stores. Until next time, remember: A timecode by any other name would last just as long. ■

CRAIG ANDERTON

## Mama's Got a Squeezebox

Fig. 1. The first, black section shows the original audio. The middle, green section shows the same audio after compression; the third, blue section shows the same audio after compression and turning up the output control. Note how softer parts of the first section have much higher levels in the third section, yet the peak values are the same.

It's one of the most used, and most misunderstood, signal processors. While people use it to make a recording "punchier," it often ends up dulling the sound instead because the controls aren't set optimally. And it was supposed to go away when the digital age, with its wide dynamic range, appeared.

Yet the compressor is more popular than ever, with more variations on the basic concept than ever before. Let's look at what's available, pros and cons of the different types, and applications.

### My Main Squeeze

Compression was originally invented to shoe-horn the dynamics of live music (which can exceed 100dB) into the restricted dynamic range of radio and TV broadcasts (around 40-50dB), vinyl (50-60dB), and tape (40dB to 105dB, depending on type, speed, and noise reduction used). As shown in Figure 1, this process lowers only the peaks of signals while leaving lower levels unchanged. A second process — which could be a gain-normalization utility if the compressor is implemented in software, or an output volume knob on a hardware unit — then boosts the overall level to bring the signal peaks back up to maximum. (Bringing up the level also brings up any noise as well, but you can't have everything.)

Even though media such as the CD have a decent dynamic range, people are accustomed to compressed sound. Compression is also useful to help soft signals overcome the ambient noise in typical home listening environments. Furthermore, analog tape has an inherent, natural compression that engineers have used (consciously or not) for nearly half a century.

There are other reasons for compression. With digital encoding, higher levels have less distortion

than lower levels — the opposite of analog technology. So when music is recorded into digital systems (tape or hard disk), input compression can shift most of the signal to a higher overall average level to maximize resolution.

Compression can create greater apparent loudness. (Commercials on TV sound so much louder than the programs because they are compressed without mercy.) Given a choice between two roughly equivalent signal sources, people will often prefer the louder one; radio stations will compress the signal not just for bandwidth reasons, but to make the signal fly out of the speakers. And of course, compression can smooth out a sound — from increasing piano sustain to compensating for a singer's poor mic technique.

### Compressor Basics

Compression is often misapplied because of

Fig. 2. The threshold is set at -8dB, and the compression ratio is 4:1. If the input increases by 8dB (e.g., from -8 to 0), the output only increases by 2dB (from -8 to -6).

the way we hear. Our ear/brain combination can differentiate between very fine pitch changes, but not amplitude. So, there is a tendency to overcompress until you can "hear the effect," giving an unnatural sound. Until you've trained your ears to recognize subtle amounts of compression, keep an eye on the meters. You may be surprised to find that even with 6dB of compression, you don't hear much apparent difference — but bypass the sucker and you'll hear a change.

Compressors, whether software- or hardware-based, have these general controls:

**Threshold** sets the level at which compression begins. Above this level, the output increases at a lesser rate than the corresponding input change. Bottom line: With lower thresholds, more of the signal gets compressed.

**Ratio** defines how much, when the input signal rises above the threshold, the output signal level changes for a given change in the input level. For example, with 2:1 compression, a

## home recording

2dB increase at the input (assuming that the input is higher than the threshold) yields a 1dB increase at the output. With 4:1 compression, a 16dB increase at the input gives a 4dB increase at the output. With "infinite" compression, the output remains constant no matter how much you pump up the input. Bottom line: Higher ratios increase the effect of the compression. Figure 2 shows how input, output, ratio, and threshold relate.

**Attack** determines how long it takes for the compression to start once it senses an input level change. Bottom line: Longer attack times let more of a signal's natural dynamics through, but those signals are not being compressed. In the days of analog recording, the tape would absorb any overload caused by sudden transients. In digital, those transients clip as soon as they exceed 0 VU. With short attack transients, this may not produce any significant audible degradation (that sound you hear is thousands of mastering engineers recoiling in horror). If there is distortion, lower the overall level with the...

**Output control.** Since we're squashing peaks, we're actually reducing the overall peak level. Increasing the output compensates for the volume drop. Turn this control up until the peak levels of the compressed signal match the peak levels of the bypassed signal.

**Decay** sets the time required for the compressor to give up its death grip on the signal once the input falls below the threshold. Short settings are great for special effects, like those psychedelic '60s drum sounds where hitting the cymbal would create a giant sucking sound on the whole kit. Longer settings work well with program material, since the level changes are more gradual and produce a less noticeable effect.

The **hard knee/soft knee** option controls how rapidly the compression kicks in. With soft knee, when the input exceeds the threshold, the compression ratio is less at first, then increases up to the specified ratio as the input increases. With hard knee (as illustrated in Figure 2), as soon as the input signal crosses the threshold, it's subject to the full amount of compression. Bottom line: Use hard when you want to clamp levels down tight (for instance, to prevent clipping in a power amp), and soft when you want a gentler compression effect.

**Side chain** jacks are available on many hardware compressors. These let you insert filters in the compressor's feedback loop to restrict compression to a specific frequency range. For example, if you insert a highpass filter, only the high frequencies are compressed — perfect for de-essing vocals.

The **link** switch in stereo compressors switches the mode of operation from dual mono to stereo. Linking the two channels together allows changes in one channel to affect the other channel, which is necessary to preserve the stereo image.

Figure 3 shows the compression module from the Jupiter Voice Processor, a plug-in for Sound Tools running on the Mac. This is a typical setting used for vocals. There was close to -6dB of noise reduction at the moment this screen shot was taken, as shown by the Noise Redux meter. There are the expected threshold, ratio, attack, release, knee amount, and output

controls; this module also includes a noise gate section with its own threshold and ratio controls.

#### Compressor Types: Thumbnail Descriptions

Compressors now come in both hardware varieties (usually a rack-mount design) and as software "plug-ins" to existing digital audio-based programs. Following is a description of various compressor types, along with some common models.

• **Old faithful.** Whether rack-mount or software-based, typical features include two channels with gain reduction amount meters (yes! lots of blinking lights!) that show how much your signal is being compressed. Typical hardware models include the Alesis 3630, dbx 166, and Aphex Compellor; for software, Digidesign's Sound Tools comes with a built-in compressor, and the Waves L1 is a very sophisticated compressor plug-in for Sound Tools or Pro Tools. Hot tip: When compressing a stereo mix, blend in some dry, non-compressed sound for a livelier, more dynamic sound.

• **Multiband compressors.** These divide the audio spectrum into multiple bands, with each one compressed individually. This allows for a less "effected" sound (for example, low frequencies don't end up compressing high frequencies), and some models let you compress only the frequency ranges that need to be compressed. Dolby's 740 Spectral Enhancer offers a superb hardware implementation of this concept. In software-land, the Jupiter Systems MDT (multiband dynamics tool) plugs into Digidesign programs.

• **Octal compressors.** Now that every man, woman, and child on the face of the earth has an 8-track digital recorder, accessories were sure to follow. The Symetrix 488 and ART MDM-8L house eight compressors in a single rack space. These help reduce the possibility of overload for signals going into your recorder, as well as bringing back some of the tape compression effects associated with analog tape (minus the distortion). These units are overkill if you're overdubbing tracks one or two at a time (just get a good stereo compressor), but for live recording, they can literally save a session.

• **Vintage & Specialty Compressors.** Some swear that only the compressor in an SSL console will do the job. Others find the ultimate squeeze to be a big bucks tube compressor, like the Deme'tre or Groove Tubes models. And some can't live without their Dan Armstrong Orange Squeezer, held by many to be the finest guitar sustainer ever made. Fact is, all compressors have a distinctive sound, and what might work for one sound source might not work for another.

Whatever kind of audio work you do, though, there's a compressor somewhere in your future. Just don't overcompress — in fact, avoid using compression as a cop-out for bad mic technique or dead strings on a guitar. I wouldn't go as far as those who diss all kinds of compression, but it is an effect that needs to be used subtly to do its best. ■

#### • Sample Audio Cd's •

##### NEW Givin' Up Da Funk • \$99.95

No Question - the best guitar sample CD on the market. Featuring studio guitar legend Vinnie Zumbo (Joe Jackson, Roger Daltrey, David Letterman). There are over 400 samples. Vinnie used all of his guitars (over 40) to make this CD. The sounds, styles, and production are quite varied. All BPM's, keys, chord changes, and track names listed. All guitar riffs are soloed for total flexibility! This disc is a must-have for all sample heads!

(P.S. - shout outs to Labella (guitar strings), ADA, Gibson, Steinberger, Epiphone, D'Mazzeo, Marshall, Pedal Pusher, SansAmp, and Zoom for making the CD sound so phat!)

##### NEW LockDown • \$99.95

Multi-coastal flavor represented on this disc. Almost all of the samples are in raw form. The drum loops are not cluttered with other instruments. The bass loops are not cluttered with drums, etc. What you get is plenty of authentic live hip hop, reggae, R&B, dance hall styled loops. Multi-platinum session drummers were used for the live material. There's also a huge collection of SP-1200 and MPC 60 drum loops for that 12 bit grunge. Live bass loops, analog synth loops, congas, shazam, hi hat, percussion loops, vocal samples, and freestyle bits. Over 1000 samples. The savings in production cost are enormous. Get it get it... Get On It!

##### Representin' Hip Hop • \$49.95

This disc that started it all. Over 700 samples. Live drums, hip hop loops, effects, subliminal sounds, scratches, and drum samples. East coast flavor - most bop's in the 90's. Peep this joint today!

5 Star Review "There is no doubt that this disc is a great bargain" - Jim Alkin, Keyboard Feb. 95

##### New York Stylin' • \$69.95

Over 140 new hip hop loops, 120 live drum loops, 100 freestyle sounds & loops, plus 360 dope drum samples. Many of the loops are 8 bars or longer! Don't take a chance with bogus CD's that cost too much. This is the real thing - definite hit potential! Here's what the critics say: "Overall, this is really one of the best hip hop sample CD's I've heard to date." - Tom Shear, Transonic Hacker. "The people at On Point were not merely trying to be hip when they put 'ghat' on the cover, the CD shows it's fairness in quality and quantity." - Scott Fisher, IMR (Independent Music Review @ Internet)

DAVE STEWART

## Your Majesty Is Like A Cream Donut

It is always a pleasure to receive letters from readers, but when the subject matter is the legendary Eric McWhirter, the pleasure turns to sheer ecstasy. Michael R. Smith, who lives in a post office box in Sylmar, CA, has sent in this exciting addition to the fast-growing McWhirter archive: "Dear Mr. Dave Stewart/Keyboard, I am flushed with excitement as I write this letter. Enclosed you will find a cassette of one of Eric McWhirter's rare studio recordings I found in a tape vault at my work. Originally

recorded for the Musak company, a brilliant young Los Angeles City College film student (Rick Rafanovic) realized its enormous emotional potential and featured it in his 1989 student film 'The La Brea Woman.' (This is true!) Although used as a source cue, this piece brought the tedious grocery shopping scene to life.

"Performing for the first time with a small (but competent) studio orchestra, McWhirter really pulls out all the stops in this Elvis Presley

tour-de-force. Just one listen to the catchy organ counter-melody in the chorus, the bold triad-based solo, or the hook-laden riffing in the fade-out and you've got to ask yourself: 'Is this guy a home organ genius?' ERIC LIVES! Enjoy."

The tune in question is "Don't Be Cruel," and McWhirter's rendition beggars belief. Rejecting the cynicism of the original, our maestro of the elegantly styled walnut veneer home console opts for a light, breezy, deceptively bland touch which perfectly evokes the wholesome,

Ex. 1. Eric McWhirter's intro-cum-playout to "Don't Be Cruel." (Elvis's publishers please note: These four bars consist entirely of original material composed by Eric McWhirter, so don't start hassling us for money.)

sanitary mood of a modern suburban supermarket. To give you a flavour of this transcendental performance, we have transcribed the intro-cum-playout (see Example 1).

After despatching the hip-swivelling rock-aballad with his customary panache (at several points cleverly working one or two white notes into his trademark black-note mode), Eric (dubbed "The Paganini of the Farfisa Beaumont" by the *Fife Examiner*) tears into the playout with ferocious abandon, using the intro's melodic motif as a basis for improvisation. Appearances can be deceptive, and a casual listener might get the impression that the Scots genius is simply playing the intro over and over again. Not so. McWhirter cognoscenti will explain that the apparent mindless repetition conceals a wealth of small variations, 'micro-changes' which are barely discernible by the untrained ear. Whatever the technical explanation, this stunning McWhirter performance had its usual effect: From the first shrilling note, my eyelids drooped, my heartbeat slowed, and within seconds I had fallen into a deep sleep from which I awoke many hours later, spiritually cleansed and ready to boogie. On behalf of Eric's fans everywhere, a big thank you to Michael Smith for this little gem. The McWhirter mythos is growing, and any information on the great one will be gratefully received and reprinted on these pages. (Well, it saves me having to write the column.) Though the current trend at the magazine favours product reviews over mere human performers, it can only be a matter of time before Eric McWhirter assumes his rightful position on the front cover of *Keyboard*. [Ed. Note: Over my dead body.]

It is embarrassing to bring up one's own mundane compositions after dealing with the work of a living legend, but I thought some of you might be interested in examining this extract from a score from years back. (See Example 2.) As you can see, the basic keyboard part is embellished with three-part female vocals (singing that timeless lyric 'aaaah, aaah, aaah,' etc.), and we have taken the unusual step of including the vocal parts because they are not merely textural. As well as making a pleasant sound, they add, in places, essential melodic and harmonic material. It is sometimes said that a definition of a 'good' composition is one which works well regardless of orchestration, and this piece fits the bill — written on a battered upright piano, it can be variously orchestrated, played soft, loud, or medium, with the melody line played on guitar, sax, flute, or keyboard! Whether that makes it 'good' music I'll leave others to judge, but I still like it a lot; in fact, I like it so much, I'm going to return to it next month in the hope of getting to the end of the score.

Though the music is, I hope, self-explanatory, I should add a few cautionary notes — I'm being serious now, so stop giggling and pay attention. Thank you. Firstly, if you're playing these parts on a synth or workstation, make sure that you've chosen the right octave. This may sound academic and/or nit-picking, but if you play the

**BAG END** is celebrating its 20th Anniversary in 1996, and with a little help from their friends at Korg, Mackie, and QSC, you can join the festivities. The *Keyboard* 20th Anniversary party has just ended, but Bag End's is just getting started, so let's kick it off with a bang! The following anniversary prize packages include components from **Korg**, the company that changed the rules, **Mackie**, a world leader in pro audio, **QSC**, makers of high-fidelity power amps, and, of course, **Bag End**, whose time-aligned speaker systems with flat frequency response and ELF Infra-sub bass are second only to earthquakes when it comes to moving the earth. To enter, simply fill in the handy tear-off card and mail it before **Jan. 31, 1996**. Good luck!

#### OFFICIAL GIVEAWAY RULES

To enter: Print your name and address on the attached entry card or a facsimile. Enter as often as you wish, but each entry must be postmarked separately. All entries for the *Keyboard*/Bag End 20th Anniversary Giveaway must be received by Jan. 31, 1996. Entrants to the *Keyboard*/Bag End 20th Anniversary Giveaway need not subscribe to *Keyboard*. The winner will be drawn at random and will be notified by mail. The prizes are non-transferable and no substitution is allowed other than made necessary due to availability by the manufacturer. Should this occur, replacement prizes of like or greater value will be provided. The winners may be required to sign and return (within 30 days of notification) an affidavit of compliance with these rules and a release for the use of his or her name for publicity purposes without further consideration. This offer is void where prohibited by law, and is subject to all applicable federal, state, and local regulations. Taxes are the sole responsibility of the winners. The *Keyboard*/Bag End 20th Anniversary Giveaway is not open to employees of participating manufacturers or Miller Freeman, Inc. Odds of winning depend on the number of entries received. The rules and conditions of the *Keyboard*/Bag End 20th Anniversary Giveaway may be changed without prior notice. Miller Freeman, Inc. shall be deemed sole interpreter of the rules and conditions.

The **Korg** X3 Power Music Workstation is a 61-key, 32-voice workstation with 200 programs, 200 combinations, 136 General MIDI programs, 16-track sequencer, dual digital multi-effects processors, built-in disk drive, and four PCM sound cards.

**Mackie**'s 8-Bus series consoles are ideal for jobs ranging from multitrack recording to film and video broadcast production. Specs include in-line monitoring, internal 116dB dynamic range, two headphone systems, discrete low-noise/high-headroom mic preamps on all channels with +48V phantom power, 100mm faders, sealed rotary pots, and much more.

**QSC**'s EX 800 and EX 1250 are advanced power amplifiers offering high power output, a comprehensive and sophisticated thermal management system, and QSC's Open Input Architecture, which allows the use of second-generation signal processing. The EX 800 offers 275 watts per channel at 4 ohms, a quiet variable-speed fan, and a three-year warranty; the EX 1250 provides 400 watts per channel at 4 ohms.

The **Bag End** Studio B System has been installed in major TV, film, and recording studios across the country. The systems include two MM-8 Time-Aligned studio monitors, one D10E-S subwoofer, and one ELF (extended low frequency) processor. This ultra-accurate system features a Time Align frequency response beyond the range of human hearing. The MM-8 monitors, with their coaxial 8" driver and proprietary Time Align crossover, offer a flat frequency response above 20kHz. The system includes the D10E-S ELF subwoofer and ELF-M low-frequency integrator, providing an extended bass response down to 18Hz, and, for the first time ever, Time Aligned bass response.

opening C#m7 chord (and all the others) an octave higher than written, you will immediately lose the warm, mellow quality which is a distinguishing quality of the piece. Secondly, be careful about the tempo — the speed is reasonably slow (♩ = 64), giving the feeling of a very slow, dreamy waltz. Thirdly, play the

melody with rhythmic precision; though the tune appears to meander, the difference between its triplets and occasional sixteenth-notes is important, and should be clearly delineated. Fourthly, watch out for the B# note in the melody in bar 3. I was tempted to use a G♭ major key signature here to avoid this accidental, but I feel okay about it now that I've

publicized the issue. (Hans Van Bellinger, clinical psychologist and author of *Stress and the Musician*, writes, "Acute anxiety over accidentals in printed scores is common. The writer is re-living the terrors of the birth experience, and must be humoured.") Lastly, don't get hot and bothered (as classical musicians sometimes seem to do) about the absence of a global key

# They *LAUGHED* when I said they could have **Perfect Pitch**

—until I showed them the **secret!**

The **TRUE STORY** behind the #1 best-selling ear-training method!

by **David L. Burge**

**I**T ALL STARTED in ninth grade as a sort of teenage rivalry.

I would slave at the piano for five hours daily. Linda didn't practice anywhere near that amount. But somehow she always seemed to have an edge which made *her* the star performer of our school.

It was frustrating.

*What does she have that I don't?* I'd wonder.

Linda's best friend Sheryl sensed my growing competition. One day she bragged on and on about Linda, adding more fuel to my fire.

"You could *never* be as good as Linda," she taunted me. "*Linda* got *Perfect Pitch*."

"What's *Perfect Pitch*?" I asked.

Sheryl gloated over a few of Linda's uncanny abilities: how she could name any tone or chord—*just by ear*; how she could sing any pitch she wanted—from *mere memory*; how she could play songs after only *listening* to them on the radio!

My heart sank. *Her fantastic EAR is the key to her success* I thought. How could I ever hope to compete with her?

But later I doubted Sheryl's story. How could anyone possibly know F# or Bb just by *listening*? An ear like that would give someone a mastery of the *entire musical language*!

Yet it bothered me. Did Linda *really* have *Perfect Pitch*? I finally got up the nerve and asked Linda point-blank if the rumors were true.

"Yes," she nodded to me aloofly.

But *Perfect Pitch* was too good to believe. I rudely pressed, "*Can I test you sometime?*"

"OK," she replied cheerfully.

## **I couldn't wait to make her eat her words...**

My plan was ingeniously simple: I picked a moment when Linda least suspected it, then boldly challenged her to name tones for me—*by ear*.

I made sure she had not been playing any music. I made her stand so she could not see the piano keyboard. I made certain that other classmates could not help her. I set everything up perfectly so I could expose Linda's *Perfect Pitch* claims as some kind of ridiculous joke.

Nervously I plotted my testing strategy. Linda appeared serene. Then, with silent apprehension, I selected a tone to play. (She'll *never* guess F#!)

I had barely touched the key.

"F#," she said.

I was astonished.

I played another tone. She didn't even stop to think. *Instantly* she announced the correct pitch.

Frantically,

I played more and more tones here and there on the keyboard.

But each time she would somehow know the pitch. She was SO amazing. She could identify tones as easily as *colors*!

"Sing an Eb," I demanded, determined to mess her up.

With barely a pause she sang the proper pitch. I had her sing tone after tone (trying hard to make them increasingly difficult). But as I checked her on the keyboard, I found that she sang each note perfectly on pitch.

I was totally boggled. "*How in the world do you do it?*" I blurted.

"I don't know," she sighed. And to my dismay, that was all I could get out of her!

David will show you his simple secret to unlock the power of your own virtuoso ear.

The dazzle of *Perfect Pitch* hit me like a ton of bricks. My head was dizzy with disbelief. Yet from that moment on I knew *Perfect Pitch* is real.

## **I couldn't figure it out...**

"*How does she DO it?*" I kept asking myself. On the other hand, why can't *everyone* recognize basic musical tones by ear? It dawned on me that most people can't tell a simple C from a C#, or the key of A major from F major! It seemed so strange that a musician would not know tones—like a painter who doesn't know colors! Or a mathematician who can't recognize numbers! Or an English teacher who cannot identify a dangling participle!

I found myself even more mystified than before. Humiliated and puzzled, I went home to work on this intriguing problem. At age 14, this was a hard nut to crack.

You can be sure I tried it myself. I would sweet-talk my three brothers and two sisters into playing tones for me, then I'd try to guess each pitch by ear. My many attempts were dismal failures.

So I tried playing the tones *over and over* in order to memorize them. I tried to feel the "highness" or "lowness" of each pitch. I tried day after day to learn and absorb those elusive tones. But nothing worked. I simply could *not* recognize the pitches by ear.

After weeks in vain, I finally gave up. Linda's *Perfect Pitch* was extraordinary—a prized trophy of talent and virtuosity. But for me, an ear like that was way out of reach.

**Autumn 1970**  
"How in the world do you do it?" I blurted.  
I was totally boggled.

## Then it happened...

It was like a miracle. A twist of fate. Like finding the lost Holy Grail.

Once I had stopped *straining* my ear, I started to listen *NATURALLY*. Then the incredible secret to Perfect Pitch jumped right into my lap.

I began to notice faint "colors" within the tones. Not *visual* colors, but colors of *pitch*, colors of *sound*. They had always been there. But this was the first time I had ever "let go"—and *listened*—to discover these subtle differences within the musical tones.

Soon—to my own disbelief—I *too* could recognize the tones by ear! It was simple. I could hear how F# sounds one way, while Bb has a *different* sound—sort of like "listening" to red and blue!

The realization struck me: THIS IS PERFECT PITCH! This is how Bach, Beethoven and Mozart could mentally envision their masterpieces—and name tones, chords and keys all by ear—*by tuning in to these subtle "pitch colors" within the tones*.

It was almost childish—I felt sure that *anyone* could unlock their own Perfect Pitch by learning this simple secret of "color hearing."

Bursting with excitement, I told my best friend Ann (a flutist) that *she* could have Perfect Pitch too. She *laughed* at me.

"You have to be *born* with Perfect Pitch," she asserted, believing that somehow I always had it.

"You just don't understand how Perfect Pitch works," I countered. "Not long ago I couldn't recognize one note. Now it's *easy*!"

I showed her how to listen. Timidly, she confessed that she too could hear the pitch colors. With this jump start, it wasn't long before Ann had *also* acquired Perfect Pitch!

We became instant school celebrities. Classmates loved to test our abilities, leaving everyone awed and amazed by the power of our virtuoso ears. Everyone was fascinated with our "supernatural" abilities, but to us it was normal.

Way back then I never would have dreamed that years later I would cause such a stir among college music professors. When I first explained my Perfect Pitch discovery, many of them *laughed* at me. You may have guessed it—they told me, "One must be *born* with Perfect Pitch." Yet once I revealed the simple *secret*—and they *heard* for themselves—you'd be surprised how fast they changed their tune!

As I continued with my own college studies, my Perfect Pitch ear allowed me to progress far faster than I ever thought possible. I even *skipped over* two required courses. Perfect Pitch made *everything* easier—performing, composing, arranging, sight-reading, transposing, improvising—and it skyrocketed my *enjoyment* of music as well. I learned that music is definitely a *HEARING* art.

## And as for Linda?

Oh yes—I'll have to backtrack a little. Time eventually found me at the end of my senior year of high school. I was now nearly 18. In the four years since I had acquired Perfect Pitch, my piano teacher insisted I had made ten years of progress. But I was still not satisfied I had truly beat out Linda. Now it was my *final chance* to prove myself.

Our local university sponsored a music festival each spring, complete with judges and awards. To my horror, they scheduled me as the last person to play—the *grand finale* of the entire event.

Linda gave her usual sterling performance. It would be tough to match, let alone surpass. I went for it. Slinking to the stage, I sat down and played my heart out.

Guess what? I scored an A+ in the most advanced performance category.

Linda only got an A.

*Sweet victory was music to my ears—mine at last!*

## Now it's YOUR turn!

These days, thousands of musicians around the world and research at two universities have also proved my Perfect Pitch method (info on request).

Now I'd like to show YOU how to experience your own Perfect Pitch! To start, you need only a few basic instructions. I've had lots of fun revealing my method in my **Perfect Pitch® SuperCourse**. It's *easy*—and you don't have to read music! It's also *guaranteed* to work for YOU—regardless of your instrument, your playing style, or your current ability level.

Try it yourself: Just order your own **Perfect Pitch® SuperCourse** and play the first two cassettes. I promise you will hear the Perfect Pitch colors that I'll start you on—or you can return the Course for a full refund. You've got my word on it. You can even read my short handbook and check your progress with no risk. You'll find a *dramatic improvement in your pitch and your playing* in only 40 days, or return the Course and I'll personally make sure you get a refund—no questions asked!

Think of the possibilities that Perfect Pitch can open for YOU and your music. Imagine how it can improve your playing, your singing—your own creativity and confidence.

And picture your friends' faces when YOU can name tones and chords with laser-like precision!

Please—don't you laugh, too! At least not until you give me a *chance* to formally introduce you to YOUR VERY OWN Perfect Pitch!

**P.S. FREE BONUS TAPE:** Try the Course *right now* and we'll also send you my 90-minute companion tape on **Relative Pitch** (a \$14.95 value)! It's the icing on your ear-training cake—yours to keep FREE—even if you decide to return your **Perfect Pitch SuperCourse** for a full refund!

The **Perfect Pitch® SuperCourse** is for ALL musicians/ALL instruments, beginning and advanced. *No music reading skills required.* **SUPERCOURSE** includes 5 audio cassettes + easy handbook + **FREE** 90-minute *bonus tape* on Relative Pitch. **40-day money back guarantee.**

◀ Continued from page 199

arpeggiate in their league, even though I can keep up in my mind. Some of the dirt is psychological. Life is an emotional minefield, and lots of potential artists have been shut down along the way by traumatic experiences (not necessarily big shocks, either; small, cumulative injuries can do huge damage over time). More than anything else, though, the dirt on the lens is false knowledge.

Say, for example, that you've heard of driving a car, but you've never seen one. Suddenly the heavens open up and a '57 candy-flake red T-bird convertible is deposited before you, glistening in a shaft of celestial light. A blonde archangel in an Armani choir robe hands you the keys and says, "Hey, take it for a spin," then vanishes. Excited, you get inside. Only now the trouble starts. Maybe you figure out where the key goes. Maybe you even figure out how to start the thing, and put it in gear. But you keep stepping on the brake when you mean to step on the gas, and the gear you keep finding is reverse, not drive, and accidentally stalling is a definite problem, and pretty soon you're feeling frustrated and the T-bird is sporting a fresh coat of dents. Meanwhile the archangel reappears, sailing past you at 75 mph in a Maserati as black as sin and polished as John F. Kennedy, Jr. It's obvious this driving business has got to be divine providence. Right?

Wrong. Same thing for drawing, painting, singing, dancing, playing an instrument, casting a bronze, or composing a symphony. If you've got a certain low minimum standard of physiological equipment, *you can learn to do these things*. You can even learn to do them well! But first you have to stop believing in "talent." You have to stop thinking you already know what these things are, and what they must feel like in the doing.

Because if you can't do them yet, it's because you don't know how they actually feel. You don't know what they really are. That simple. You just know what you *think* they are — and you're wrong.

Small wonder, then, that when you try them you don't get anywhere.

At this point, in person, I usually hear a flood of rebuttal from those who consider themselves aggressively untalented in some field. This is my cue to haul out Betty Edwards' book. Two things make it particularly useful. First, this art stuff is a litmus test. Folks really do see it as dependent on "talent," even more than writing and making music, so those who think that they can't draw are absolutely sure of their position: some can, they can't, that's that. Second, Edwards has the perfect counter in the form of dozens of dated before-and-after drawings by her students.

I love to put my finger over the dates and then show these paired illustrations to protesting non-artists. On the left they see a prime example of bad self-portraiture, the kind of

scrawl only a very young child might love. On the right they see a sophisticated self-portrait, a drawing that shows a strong grasp of light, shadow, line, form, and spatial relationships. Put more bluntly: talent zip on the left, while on the right, talent galore.

Then I lift my finger, and their jaws drop — because in example after example the difference between utter crap and unquestionable drawing ability is a matter not of decades, or years, but of only a few months. In a very real sense, these students didn't learn how to draw at all. Instead, through the exercises in Edwards' program, they *unlearned* their false beliefs about drawing. They cleared that bit of dirt off the lens, and discovered a part of themselves that had always been there, but that they had never known.

Edwards' main point can be summed up in a single example. When a person who "can't draw" is handed pencil, paper, and a teacup for a model, they don't trust their natural eye-hand coordination and right-brain spatial-processing intelligence. Instead they override these links and try to think their way through the task, using the more left-brain tools of logic and language. In this part of their head they know that the top of a teacup is round, so straight-away they draw a circle (ignoring the foreshortened ellipse they actually see). They also know that a teacup's handle is round, so they draw another circle for it, disconnected from the first. And the sides are rounded curves, so . . . now wait a minute, how come this doesn't look right? The answer is that the cup in their head is broken. In fact it isn't really a cup at all, or a picture of one, but a conceptual list of facts *about* a cup. Attempting to draw by laboriously rendering the individual elements of that list, each in isolation from the others, is like trying to talk by spelling out the letters in every word. I.t.m.a.y.c.o.m.m.u.n.i.c.a.t.e.s.o.m.e.t.h.i.n.g.b.u.t.n.o.t.v.e.r.y.w.e.l.l.

What Edwards does is short-circuit this mistaken process. Her exercises take the left brain out of the loop and let the right brain, eye, and hand get on with something they are just naturally good at, given the chance: drawing. From that foundation, bit by bit, she illuminates the real rules of the visual arts, which are fewer and simpler than anyone outside the activity might dream. Result? Frogs into princes, dross into gold, damaged non-artists into happier, healthier human beings who have learned a surprising thing . . . they actually can draw after all.

So. If drawing — generally considered the most mysterious "talent" of them all — is as natural and fundamental a human capacity as walking or talking, and considerably easier than making sense of an NFL betting pool, then what does that say about all the other creative pleasures we may be denying ourselves?

Hmmm. We'll never know until we try. ■

## INSTRUMENTS

Buying or selling instruments through our Classified Ads offers you convenience, a big marketplace, and a wide range of instruments and prices. However, buying mail order does have its drawbacks, too. Keyboard suggests the following guidelines to help the buyer and the seller in these transactions: 1) Get a written description of the instrument, which should include the serial number; 2) Get front and back photos of the instrument; 3) Get a written purchase agreement, with a 24-hour approval clause allowing the buyer to return the instrument for a full refund if it does not meet his/her reasonable expectations.

## The McClintock PIANO COURSE

### A New Experience in Learning

*Have you wished you could read music and play the piano, but never had the time to take lessons?*

Now, without previous knowledge of music or the keyboard, you can confidently teach yourself at home—at your own pace.

After 30 years of research and experimentation, a complete Course (from basics to Bach) is available. Recommended by and for students, music educators and professionals.

3 volumes of music and 8 volumes of corresponding text in 2 handsomely boxed sets. Price: \$388 plus tax where applicable. For a free brochure, write or call: **McClintock Enterprises**, 853 Seventh Avenue, New York, New York 10019 800-428-0018 or 212-956-3529

**MODERN BLUES FOR KEYBOARD – VIDEO** – Learn the hottest licks, techniques, chord voicings, and flashy tricks from this new instructional video. Covers theory, voice leading and combining scales for blues, jazz and rock. Not just a few simple beginner licks but a comprehensive approach to understanding how to play and arrange the blues. Every technique broken down into simplified steps with bass lines clearly demonstrated. Money-back guarantee. \$49.95 + \$3.00 for postage. Send check to: Alex Glaros, Department KB1, 6065 Calvine Rd., Sacramento, CA 95823.

**Short Cuts** to playing blues, jazz, rock, gospel, new age, R&B, Latin. Book/cassette/CD with optional MIDI file disks show you how. All levels. New product: 100 Ultimate Blues Riffs. Free info. (800) 748-5934. A.D.G. Productions, 15517 Cordary, Lawndale, CA 90260.

◀Continued from page 171

were real horns backing him up. And how about "Jive Talking" by the Bee Gees?

Steve Hofer  
Indianapolis, IN

### Happy Accident(al)s

I was surprised to see the spelling errors in Fred Hersch's Solo Piano column in the September issue. In Example 1, bar 2, where the chord is shown as *D7aug*, the note between an A and a B should be A#, not Bb. Likewise, in bar 6 of the same example the Eb melody note above a *G7aug* chord should have been notated as a D#. Yes, on a piano Bb and A# sound exactly the same. But that doesn't mean there isn't a difference. As professional writers, would you confuse "right" with "write"?

Ethan Winer  
New Milford, CT

[Ethan — You're right about the enharmonic spelling, but the real mistake was publishing a melody that's in the key of Bb with no key signature. Both the Bb and Eb melody notes are spelled properly with reference to the key of the song, which leaves theorists with an uncomfortable dilemma: Do you grotesquely distort the spelling of the melody in order to accommodate the correct chord spelling, do you substitute a chord symbol (in this case,

*D7b13*) that refers to the correct melody note but makes reading the chord chart harder and perhaps misrepresents the function of the chord in the progression, or do you bite the bullet (as many jazz players do) and simply accept an imperfect notation system that gets the player's fingers onto the correct keys? In a crunch, we opt for the latter.]

### Sex, Schmex

I can't believe how so many people are spending too much time and space to discuss some ads that used women to sell music products! I personally didn't like the ads, but I think the manufacturers have to be free to use whatever they want to call attention to their products. And surely they got the attention. Okay, folks, let's talk about music.

Miguel Ratton  
Rio de Janeiro, Brasil

Did you know Sydney Urshan Music and Symetrix were mentioned by your readers 22 times in four months? Hats off to the ad agencies for truly successful campaigns!

Andrew Furgal  
Chicago, IL

[Andrew — That's 23.]

### Something Old, Something New

Years before Mr. Halpern published his music,

we enjoyed the music of Deuter, a German composer who resides in the USA. His music has been used for 25 years for relaxation and healing by professionals all over the world.

Monika Luders  
Kula, HI

Giving Steven Halpern [Sept. '95] credit for being the "father of new age" is erroneous. He seems to think he created this musical genre, but throughout music history, musical styles have evolved out of preceding styles. It's easy to understand how new age music trickled down from classical, jazz, folk, and ethnic music. While Halpern *does* deserve credit for campaigning for the acceptance of new age music, let's not forget the musicians who were out there before 1969, musicians like Tony Scott, Paul Horn, Paul Winter, Will Ackerman, and Tangerine Dream (to name a few).

Lois D. Snow  
Paducah, KY

### Harum Scarum

Come on, guys, how about an article on the first progressive rock band, Procol Harum — the only such band deserving of the label "symphonic." Avoid my suggestion and risk eternal disgrace!

George Bertok  
Peterborough, Ontario  
Canada

## The Cup In Your Head Is Broken

**T**he audience sitting inside the private screening room was not what you would call homogenous. In fact, it was polarized pretty neatly, if along unconventional lines: one-half miscellaneous science fiction fans, mostly overweight and relatively ragged, and one-half doctors and lawyers and their wives and close relatives, also overweight but so far from ragged that they looked waxed and buffed. The year was 1975. The location was Chevy Chase, an upscale Maryland suburb of Washington D.C. What had brought these two vastly different collections of people together was the movie version of Harlan Ellison's *A Boy and His Dog*. The science fiction fans were there by way of apology: The film's originally-planned premiere at the World SF Convention, just a few months before, had been shut down by technical disasters. The professional crowd was there by way of influence: They were either investors or close friends of investors, and the producer wanted them happy.

The room darkened. The projector rolled. The story — a grim, satirical slice of life in post-nuclear war America, starring a very young Don Johnson — unfolded. Then the lights came on again, and the producer stood up and asked if anyone had questions or comments.

To understand what happened next you need to know only this much about the story: It's kind of your classic Boy and Telepathic Talking Dog Meet Girl, Boy Loses Dog, Boy Wins Girl, Dog Gets Shot and is Starving, Boy Regretfully Kills Girl and Feeds Her to Dog to Save Him storyline. The ending of Harlan's savage original went this way: "She'd asked him if he knew what love was. Sure. A boy loves his dog." The movie opted for a *really* wry pun by the dog instead, which is either gross or funny depending on how you respond to black humor, and backed it with a tasteful lack of explicit visuals. You don't see the killing or the cooking or the eating.

Okay. You've got the gist. So the producer got up and asked for responses, and right away a little silver-haired lady in her late 60s, part of the monied contingent, put her hand up and tremulously said, "I didn't like the ending."

All the SF fans shook their heads condescendingly. Of course she didn't like the ending. Big surprise, they thought; she's exactly the kind of smug, conservative, unthinking Status Quo American the last third of the movie satirizes!

But the producer was being real polite. After all, these people paid his salary. "And what didn't you like about the ending, ma'am?"

The woman paused, looking very serious. Then she spoke, just as sweetly and honestly as possible, and with a voice and manner straight from the Perfect Grandmother training video. Only what she said was . . .

"Well, I felt cheated. If I'm going to go to a movie with cannibalism at the end, I'd like to at least see an arm or a leg on a spit or something."

. . . and the eyelids of every SF fan in the room snapped wide open in shock. You could hear the lashes bounce.

Never can tell, can you? The world is surprising. There are carnivorous grannies wearing cultured pearls, and saints in fifth-hand flannel. Which is why it isn't necessarily safe nor sane to be too certain.

More often than not a *preconception* is just a *misconception* that hasn't been exploded yet.

For a wonderful example of this truth as it relates to the creative arts, the curious need look no further than a book by Betty Edwards called *Drawing on the Right Side of the Brain*. Its subtitle is "A Course in Enhancing Creativity and Artistic Confidence," and for years I have recommended it with unrestricted enthusiasm to every creator (or creator-wannabe) I have met, especially those whose talents do not apparently reside in the visual arts. This book puts dynamite under one of the world's most cherished assumptions regarding creative people, and gleefully lights the fuse.

The assumption I'm talking about is talent. You know — that God-given, either-you-have-it-or-you-don't stuff. That exquisite essence of sensibility which the lucky among us were born with and everyone else can go suck sewer pipes. That incredible, mind-boggling, unmitigated . . . lie.

There is no such thing as talent. Or lack of talent. What there is, actually, is just one big light that is willing to shine through every person on the planet, in any way said person may want, if only there wasn't so much dirt on their personal lens. Some of the dirt is impatience. It takes time to train the hands and arms to the level of unconscious coordination necessary to play Mozart, and not everyone is willing to cut their neuromuscular system that much slack. Some of the dirt is physiological limitation. Rick Wakeman and Eddie Van Halen have a higher percentage of fast-twitch muscle fibers than I do, so I'll never hammer-on or

## KURZWEIL'S POWERFUL NEW K2500R/S

**THE PRODUCTION STATION** – Kurzweil introduces its most powerful sampling synthesizers ever: the **K2500R** and **K2500RS**. So powerful and flexible, they let you take a project from conception to completion without leaving the instrument. So advanced, they interface with a myriad of analog and digital formats.

The **K2500** racks combine Kurzweil's proprietary **V.A.S.T.**® synthesis, 48-note polyphony, a new soundset, effects processor, sequencer, and Advanced File Management System (AFMS).

**V.A.S.T. POWER** – Variable Architecture Synthesis Technology

offers 60 DSP functions arrangeable in 31 algorithms, allowing you to use different

methods of synthesis within the same program.

**UPGRADABILITY** – Optional upgrades for the **K2500R** virtually eliminate the need for outside gear. The **KDFX Digital Effects Option** provides four stereo buses and state-of-the-art DSP. The **DMTi Digital Multitrack Interface** offers four stereo channels of digital format and sample rate conversion in real time. The **Orchestral ROM**, **Contemporary ROM** or **Stereo Digital Piano SoundBlocks**

offer a total of 28 MB of Kurzweil's finest sounds.

**SAMPLE WHILE PLAY** –

The **SMP-2 Sampling Option** has digital and optical I/O; its sample-while-play feature lets you record samples while continuing other operations.

**SOFTWARE UPGRADES IN A FLASH** – With **Flash ROM**, you can upgrade your operating system from floppy disk or via SCSI.

**STUNNING ON-BOARD SOUNDS** – For the **K2500R**, Kurzweil unveils a stunning new soundset of 200 programs and 100 setups, plus a separate disk containing 1,000 useful programs.

You can also load samples from most formats (DOS, AIFF, WAV, Roland®, Akai®, Ensoniq®) and process them with **V.A.S.T.**

**THE REVOLUTION BEGINS** – Want to gear up for the next revolution? What are you waiting for? Visit your local authorized Kurzweil dealer today, and try the **K2500R** for yourself.

- ✦ 48-note polyphony
- ✦ Up to 128 MB sample RAM
- ✦ Up to 28 MB internal ROM sounds
- ✦ Up to 1.26 MB program memory
- ✦ 32-track sequencer
- ✦ 28 on-board effects algorithms
- ✦ Flexible analog & digital interfacing
